

RGx00U&RM500U Series

TCP/IP Application Note

5G Module Series

Version: 1.0

Date: 2023-07-20

Status: Released

RGx00U&RM500U 系列 TCP/ IP 应用说明

5G模块系列

版本：1.0

日期：2023年7月20日

状态：已发布

At Quectel, our aim is to provide timely and comprehensive services to our customers. If you require any assistance, please contact our headquarters:

Quectel Wireless Solutions Co., Ltd.

Building 5, Shanghai Business Park Phase III (Area B), No.1016 Tianlin Road, Minhang District, Shanghai 200233, China

Tel: +86 21 5108 6236

Email: info@quectel.com

Or our local offices. For more information, please visit:

<http://www.quectel.com/support/sales.htm>.

For technical support, or to report documentation errors, please visit:

<http://www.quectel.com/support/technical.htm>.

Or email us at: support@quectel.com.

Legal Notices

We offer information as a service to you. The provided information is based on your requirements and we make every effort to ensure its quality. You agree that you are responsible for using independent analysis and evaluation in designing intended products, and we provide reference designs for illustrative purposes only. Before using any hardware, software or service guided by this document, please read this notice carefully. Even though we employ commercially reasonable efforts to provide the best possible experience, you hereby acknowledge and agree that this document and related services hereunder are provided to you on an "as available" basis. We may revise or restate this document from time to time at our sole discretion without any prior notice to you.

Use and Disclosure Restrictions

License Agreements

Documents and information provided by us shall be kept confidential, unless specific permission is granted. They shall not be accessed or used for any purpose except as expressly provided herein.

Copyright

Our and third-party products hereunder may contain copyrighted material. Such copyrighted material shall not be copied, reproduced, distributed, merged, published, translated, or modified without prior written consent. We and the third party have exclusive rights over copyrighted material. No license shall be granted or conveyed under any patents, copyrights, trademarks, or service mark rights. To avoid ambiguities, purchasing in any form cannot be deemed as granting a license other than the normal non-exclusive, royalty-free license to use the material. We reserve the right to take legal action for noncompliance with abovementioned requirements, unauthorized use, or other illegal or malicious use of the material.

法律声明

我们以服务形式为您提供信息。所提供的信息基于您的需求，并竭尽全力确保其质量。您需自行承担在设计预期产品时运用独立分析与评估的责任，我们提供的参考设计方案仅作示例用途。在使用本文件指导的任何硬件、软件或服务前，请务必仔细阅读本声明。尽管我们已尽商业合理努力提供最佳体验，但您特此确认并同意：本文件及相关服务均以“可用”状态提供。我们有权随时自行修订或重述本文件，且无需事先通知。

使用与披露限制

许可协议

我方提供的文件及信息应予以保密，除非获得特别授权。除本协议明确规定的用途外，不得以任何其他目的访问或使用。

版权

本协议项下我方及第三方产品可能包含受版权保护的材料。未经书面授权，不得复制、分发、合并、出版、翻译或修改此类受版权保护的材料。我方及第三方对受版权保护的材料享有专有权利。任何专利、版权、商标或服务标志权利均不得授予或转让相关许可。为避免歧义，任何形式的购买行为均不视为授予许可，仅构成正常使用材料的非独家免版税许可。对于违反上述规定、未经授权使用或恶意使用材料的行为，我方保留采取法律行动的权利。

Trademarks

Except as otherwise set forth herein, nothing in this document shall be construed as conferring any rights to use any trademark, trade name or name, abbreviation, or counterfeit product thereof owned by Quectel or any third party in advertising, publicity, or other aspects.

Third-Party Rights

This document may refer to hardware, software and/or documentation owned by one or more third parties ("third-party materials"). Use of such third-party materials shall be governed by all restrictions and obligations applicable thereto.

We make no warranty or representation, either express or implied, regarding the third-party materials, including but not limited to any implied or statutory, warranties of merchantability or fitness for a particular purpose, quiet enjoyment, system integration, information accuracy, and non-infringement of any third-party intellectual property rights with regard to the licensed technology or use thereof. Nothing herein constitutes a representation or warranty by us to either develop, enhance, modify, distribute, market, sell, offer for sale, or otherwise maintain production of any our products or any other hardware, software, device, tool, information, or product. We moreover disclaim any and all warranties arising from the course of dealing or usage of trade.

Privacy Policy

To implement module functionality, certain device data are uploaded to Quectel's or third-party's servers, including carriers, chipset suppliers or customer-designated servers. Quectel, strictly abiding by the relevant laws and regulations, shall retain, use, disclose or otherwise process relevant data for the purpose of performing the service only or as permitted by applicable laws. Before data interaction with third parties, please be informed of their privacy and data security policy.

Disclaimer

- a) We acknowledge no liability for any injury or damage arising from the reliance upon the information.
- b) We shall bear no liability resulting from any inaccuracies or omissions, or from the use of the information contained herein.
- c) While we have made every effort to ensure that the functions and features under development are free from errors, it is possible that they could contain errors, inaccuracies, and omissions. Unless otherwise provided by valid agreement, we make no warranties of any kind, either implied or express, and exclude all liability for any loss or damage suffered in connection with the use of features and functions under development, to the maximum extent permitted by law, regardless of whether such loss or damage may have been foreseeable.
- d) We are not responsible for the accessibility, safety, accuracy, availability, legality, or completeness of information, advertising, commercial offers, products, services, and materials on third-party websites and third-party resources.

1 Introduction

Quectel RG200U series, RG500U series and RM500U series modules feature an embedded TCP/IP stack, which enables the host to access the Internet directly through AT commands. This greatly reduces the dependence on external PPP and TCP/IP protocol stacks and thus minimizes the cost.

RG200U series, RG500U series and RM500U series modules provide the following socket services: TCP client, UDP client, TCP server and UDP server.

This document introduces how to use the TCP/IP function of Quectel RG200U series, RG500U series and RM500U series modules through AT commands.

1.1. The Process of Using TCP/IP AT Commands

Through TCP/IP AT commands, the host can configure PDP context, activate/deactivate PDP context, start/close socket service and send/receive data via socket service. The following figure illustrates the process of using TCP/IP AT commands.

1 引言

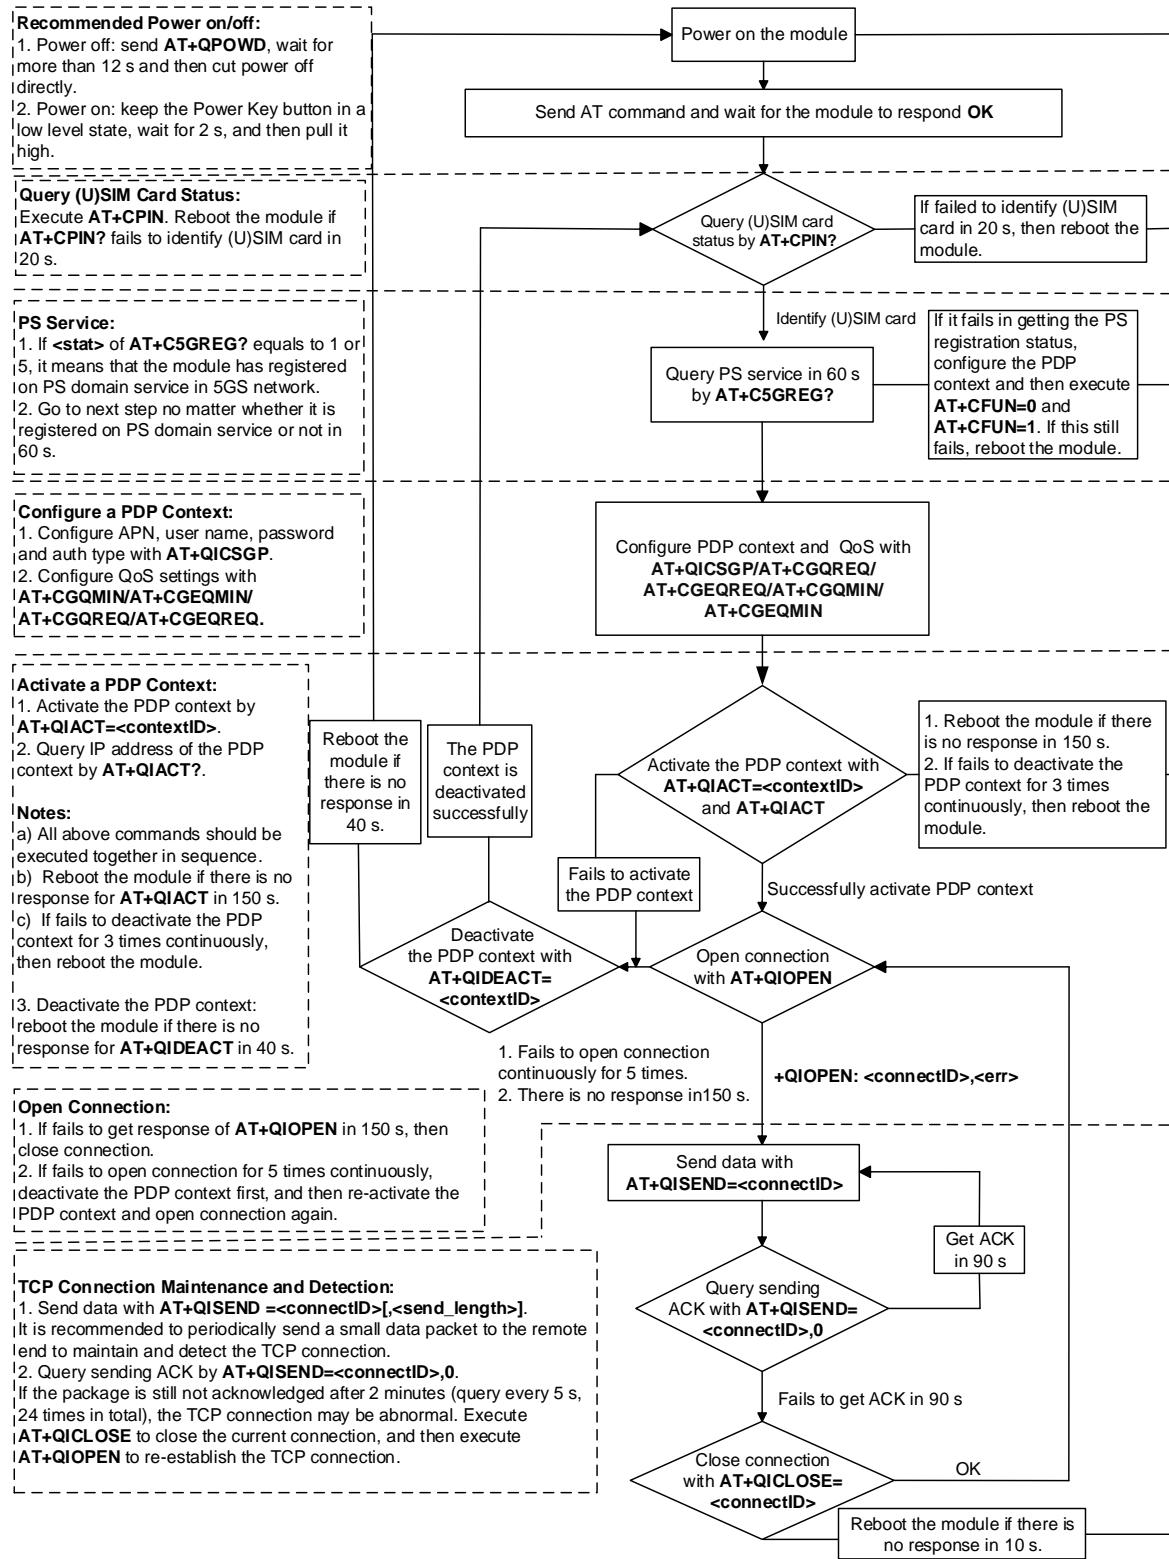

Quectel RG200U系列、RG500U系列和RM500U系列模块均内置TCP/IP协议栈，主机可通过AT命令直接访问互联网。这显著降低了对外部PPP和TCP/IP协议栈的依赖，从而有效控制成本。

RG200U系列、RG500U系列和RM500U系列模块提供以下套接字服务：TCP客户端、UDP客户端、TCP服务器和UDP服务器。

本文介绍了如何通过AT命令使用Quectel RG200U系列、RG500U系列和RM500U系列模块的TCP/IP功能。

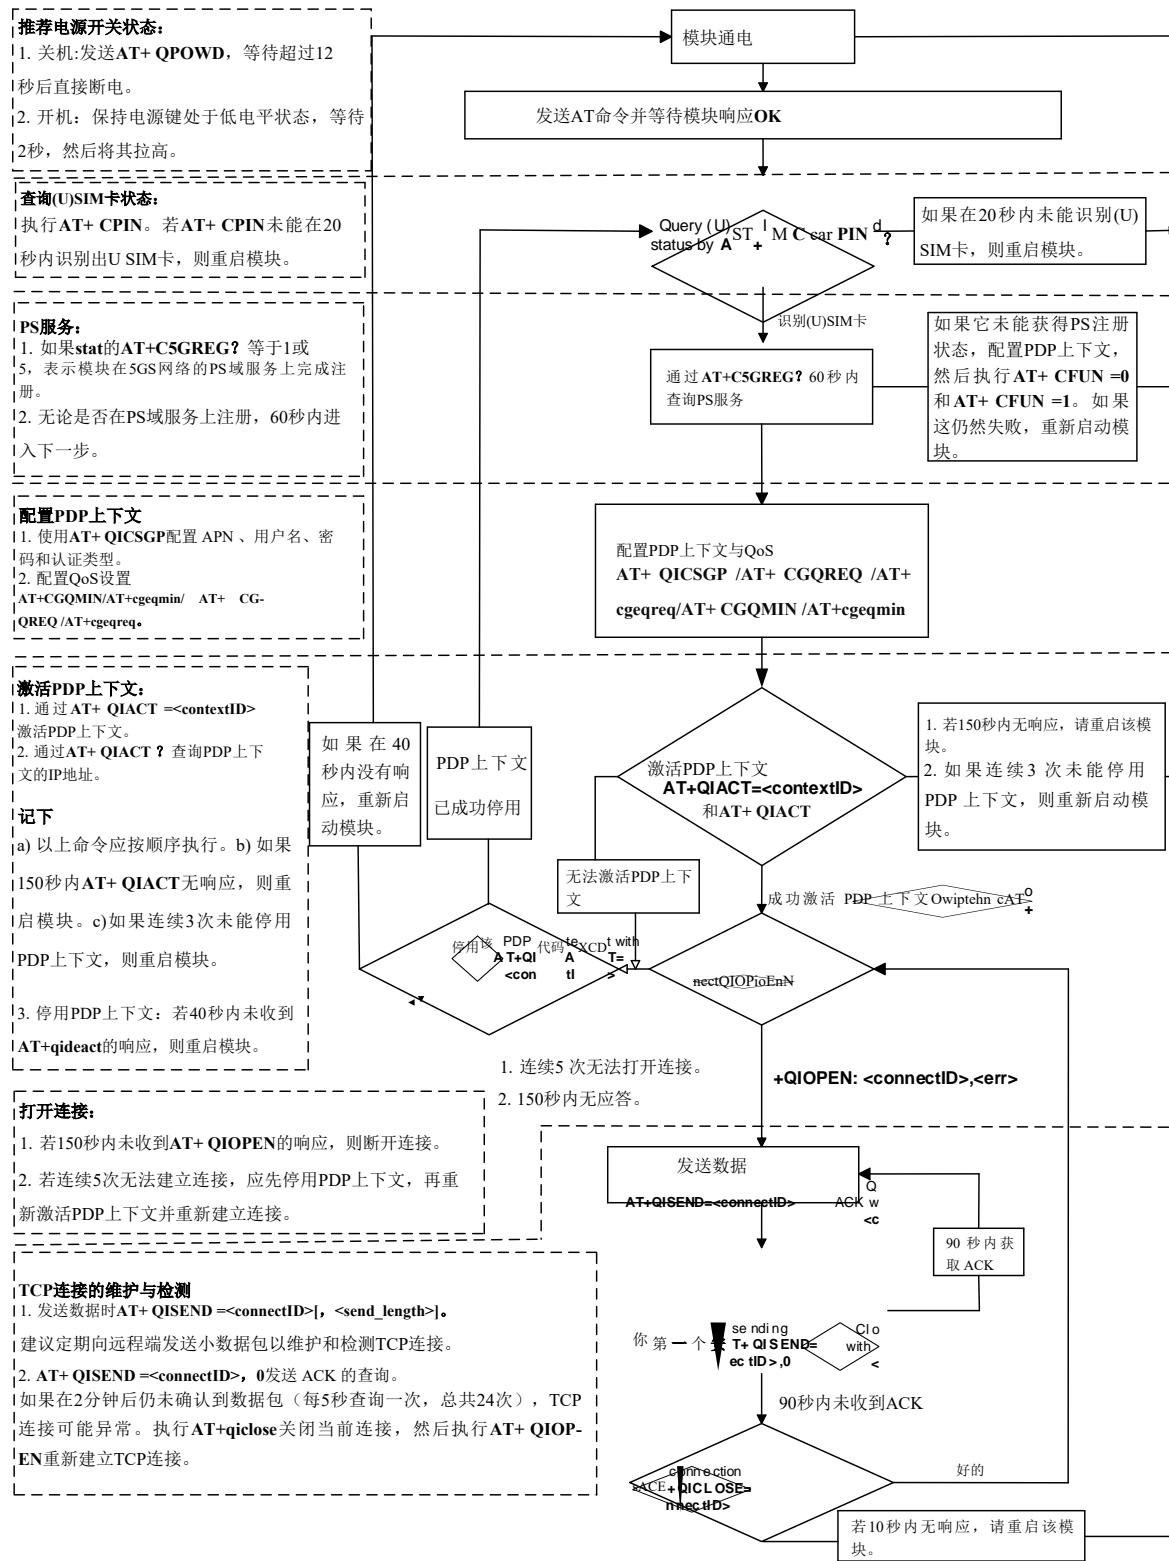

1.1. TCP/IP AT命令的使用过程

通过TCP/IP AT命令，主机可以配置PDP上下文，激活/停用PDP上下文，启动/关闭套接字服务，通过套接字服务发送/接收数据。

**Notes:**

1. Please note that users need to wait for the final response (for example "OK", "CME ERROR", "CMS ERROR") of the last AT command you entered before you enter the next AT command. You can reboot the module if the module fails to get response in 60 s.
2. Reboot the module if the module has not got response of **AT+QIACT** in 150 s or response of **AT+QCLOSE** in 10s or response of **AT+QIDEACT** in 40 s.
3. It is NOT recommended to frequently reboot the module. When the module failed to reboot for 3 times continuously for AT command execution, it can be rebooted immediately for the first time. If it still fails, reboot the module after 10 minutes for the second time, and reboot after 30 minutes for the third time if it still fails for the second time. By analogy, gradually increase the reboot interval.

Figure 1: Flow Chart of Using TCP/IP AT Commands

记下

1. 请注意, 用户需要等待最后输入的AT命令的最终响应(例如“OK”、“CME错误”、“CMS错误”)后, 才能输入下一个AT命令。如果模块在60秒内未收到响应, 可重启模块。
2. 若模块在150秒内未收到AT+ QIACT响应, 或在10秒内未收到AT+qiclose响应, 或在40秒内未收到AT+qideact响应, 则重启该模块。
3. 不建议频繁重启该模块。当该模块连续3次执行AT命令时未能重启, 可首次立即重启。若仍失败, 第二次重启模块10分钟后, 若第二次重启仍失败则第三次重启30分钟后。同理, 逐步增加重启间隔。

图1: TCP/IP AT命令使用流程图

1.2. Description of Data Access Modes

RG200U series, RG500U series and RM500U series modules support the following three data access modes:

- Buffer access mode
- Direct push mode
- Transparent transmission mode

When opening a socket service by **AT+QIOPEN**, the data access mode can be specified by **<access_mode>**. After a socket service is successfully opened, the data access mode can be switched by **AT+QISWTMD**.

1. In buffer access mode: data can be sent by **AT+QISEND**. If the module has received the data from the Internet, it will buffer the data and report the URC **+QIURC: "recv",<connectID>**. Data can be read by **AT+QIRD**.
2. In direct push mode: data can be sent by **AT+QISEND**. If the module has received the data from the Internet, the data will be outputted to COM port directly in the format of **+QIURC: "recv",<connectID>,<current_recvlength><CR><LF><data>** or **+QIURC: "recv",<connectID>,<current_recvlength>,<remoteIP>,<remote_port><CR><LF><data>**.
3. In transparent transmission mode: the corresponding port (such as UART, USB modem port, etc.) enters the exclusive mode. The data received from COM port will be sent to the Internet directly. The data received from the Internet will be outputted via COM port directly.

● Exit from transparent transmission mode

To exit from the transparent transmission mode, **+++** or DTR (**AT&D1** should be set first) can be used. To prevent the **+++** from being misinterpreted as data, the following operations should be followed:

- 1) Do not input any character within 1 s or longer before inputting **+++**.
- 2) Input only **+++** within 1 s with no other character during this period.
- 3) Do not input any character within 1 s after **+++** has been inputted.
- 4) Use **+++** or DTR (**AT&D1** should be set first) to make the module exit from transparent transmission mode, and wait until **OK** is returned.

● Return to transparent transmission mode

- 1) By executing **AT+QISWTMD**: specify **<access_mode>=2** and it will return **CONNECT** when the connection enters transparent transmission mode successfully.
- 2) By executing **ATO**. After exiting from transparent transmission mode, execute **ATO** will switch back to transparent transmission mode again. It will return **CONNECT** when the

1.2. 数据访问模式说明

RG200U系列、RG500U系列和RM500U系列模块支持以下三种数据访问模式：

- 缓冲存取方式
- 直接推送模式
- 透明传输模式

通过AT+QIOPEN打开一个套接字服务时，数据访问模式可以通过**access_mode**指定。套接字服务成功打开后，数据访问模式可以通过**AT+qiswtmd**切换。

1. 在缓冲区访问模式下：数据可以通过**AT+QISEND**发送。如果模块从互联网接收了数据，它将缓冲数据并报告URC+**QIURC**：“recv”，<connectID>。数据可以通过**AT+QIRD**读取。
2. 在直接推送模式下：数据可通过**AT+QISEND**发送。若模块已从互联网接收数据，数据将以+**QIURC**：“recv”，<connectID>，<current_recvlength><CR><LF><data> 或 +**QIURC**：“recv”，<connectID>，<current_recvlength>，<remoteIP>，<remote_port><CR><LF><data>的格式直接输出至COM端口。
3. 在透明传输模式下，对应端口（如UART、USB调制解调器端口等）进入专用模式。从COM端口接收的数据将直接发送至互联网，而从互联网接收的数据则直接通过COM端口输出。

● 退出透明传输模式

要退出透明传输模式，可先设置+++或DTR（**AT&T1**）。为避免+++被误判为数据，需遵循以下操作步骤：

- 1) 在输入++前1秒或更长时间内不得输入任何字符。
- 2) 在此期间仅输入+++且无其他字符，且输入时间需在1秒内完成。
- 3) 输入+++后1秒内不得输入任何字符。
- 4) 使用+++或DTR（**AT&T1**应优先设置）使模块退出透明传输模式，并等待返回**OK**。

● 恢复透明透射模式

- 1) 通过执行**AT+qiswtmd**：指定**access_mode**=2，当连接成功进入透明传输模式时将返回**connect**。
- 2) 执行**ATO**。退出透明传输模式后，执行**ATO**将再次切换回透明传输模式。当返回**connect**时

connection enters transparent transmission mode successfully. If no connection has entered transparent transmission mode before, it will return **NO CARRIER** after executing **ATO**.

NOTE

1. In buffer access mode, if the buffer is not empty, the module will not report any new URC until all the received data has been read from the buffer by **AT+QIRD**.
2. In transparent transmission mode, AT commands cannot be executed. If the socket connection is closed because of network error or other errors, the module will report **NO CARRIER** and exit from the transparent transmission mode. In this case, **AT+QICLOSE** should be executed to close the socket service.

连接成功进入透明传输模式。若连接此前未进入透明传输模式，则执行**ATO**后返回**NO carrier**。

注释

1. 在缓冲区访问模式下，如果缓冲区不为空，模块将不会报告任何新的URC，直到所有接收到的数据都从缓冲区读取完成**AT+QIRD**。
- ~ 在透明传输模式下，无法执行AT命令。如果由于网络错误或其他错误导致套接字连接关闭，模块将报告**NO carrier**并退出透明传输模式。在这种情况下，应执行**AT+qiclose**以关闭套接字服务。

2 Description of TCP/IP AT Commands

This chapter introduces AT command related to TCP/IP.

2.1. AT Command Introduction

2.1.1. Definitions

- **<CR>** Carriage return character.
- **<LF>** Line feed character.
- **<...>** Parameter name. Angle brackets do not appear on the command line.
- **[...]** Optional parameter of a command or an optional part of TA information response. Square brackets do not appear on the command line. When an optional parameter is not given in a command, the new value equals to its previous value or the default settings, unless otherwise specified.
- **Underline** Default setting of a parameter.

2.1.2. AT Command Syntax

All command lines must start with **AT** or **at** and end with **<CR>**. Information responses and result codes always start and end with a carriage return character and a line feed character: **<CR><LF><response><CR><LF>**. In tables presenting commands and responses throughout this document, only the commands and responses are presented, and **<CR>** and **<LF>** are deliberately omitted.

Table 1: Types of AT Commands

| Command Type | Syntax | Description |
|---------------|---|--|
| Test Command | AT+<cmd>=? | Test the existence of corresponding command and return information about the type, value, or range of its parameter. |
| Read Command | AT+<cmd>? | Check the current parameter value of corresponding command. |
| Write Command | AT+<cmd>=<p1>[,<p2>[,<p3>[...]]] | Set user-definable parameter value. |

2 TCP/IP AT命令说明

本章介绍与TCP/IP有关的AT命令。

2.1. AT命令介绍

2.1.1. 定义

- <CR> 回车字符。
- <LF> 行进给字符
- <...> 参数名称。命令行中不会显示角括号。
- [...] 命令的可选参数或TA信息响应的可选部分。命令行中不显示方括号。若命令未指定可选参数，则新值将等于其先前值或默认设置，除非另有说明。
- 下划线参数的默认设置。

2.1.2. AT命令语法

所有命令行必须以**AT**或**at**开头，并以**CR**结尾。信息响应和结果代码始终以回车字符和换行字符开头和结尾：**CR><LF><response><CR><LF>**。在本文档中呈现命令和响应的表格中，仅展示命令和响应，而**CR**和**LF**被刻意省略。

表1：AT命令类型

| 命令类型 | 语法 | 描述 |
|------|----------------------------------|-----------------------------|
| 测试命令 | AT+<cmd>=? | 检测对应命令的存在，并返回其参数的类型、值或范围信息。 |
| 读命令 | AT+<cmd>? | 检查对应命令的当前参数值。 |
| 写入命令 | AT+<cmd>=<p1>[,<p2>[,<p3>[...]]] | 设置用户可定义参数值。 |

Execution Command **AT+<cmd>**

Return a specific information parameter or perform a specific action.

2.2. Declaration of AT Command Examples

The AT command examples in this document are provided to help you learn about the use of the AT commands introduced herein. The examples, however, should not be taken as Quectel's recommendations or suggestions about how to design a program flow or what status to set the module into. Sometimes multiple examples may be provided for one AT command. However, this does not mean that there is a correlation among these examples, or that they should be executed in a given sequence.

2.3. Description of AT Commands

2.3.1. AT+QICFG Configure Optional Parameters

This command configures optional parameters.

AT+QICFG Configure Optional Parameters

Test Command

AT+QICFG=?

Response:

+QICFG: "transpktsize",(range of supported <transpktsize>s)
+QICFG: "transwaittm",(range of supported <transwaittm>s)
+QICFG: "dataformat",(list of supported <send_data_format>s),
(list of supported <recv_data_format>s)
+QICFG: "viewmode",(list of supported <view_mode>s)
+QICFG: "tcp/retranscfg",(range of supported <max_backoffs>s),(range of supported <max_rto>s)
+QICFG: "dns/cache",(list of supported <DNS_cache>s)
+QICFG: "qisend(timeout",,(list of supported <time>s)
+QICFG: "passiveclosed",,(list of supported <closed>s)
+QICFG: "tcp/accept",,(list of supported <state>s)
+QICFG: "tcp/keepalive",,(list of supported <enable>s),(range of supported
<idle_time>s),(range of supported <probe_cnt>s)
+QICFG: "recvind",,(list of supported <enable>s)
+QICFG: "close mode",,(range of supported <close_mode>s)
+QICFG: "sendinfo",,(list of supported <send_view_mode>s)
+QICFG: "formatcfg",,(range of supported <format>s)

OK

执行命令AT+<cmd>

返回特定信息参数或执行特定操作。

2.2. AT命令示例声明

本文档提供的AT命令示例旨在帮助您掌握文中介绍的AT命令使用方法。但需注意，这些示例并非Quectel公司对程序流程设计或模块状态设置的建议。同一AT命令可能包含多个示例，但这并不意味着这些示例之间存在关联性，也不代表必须按特定顺序执行。

2.3. AT命令说明

2.3.1. AT+ QICFG 配置可选参数

该命令用于配置可选参数。

AT+ QICFG 配置可选参数

测试命令

AT+QICFG=?

应答：

+ QICFG : "transpktsize" , (支持的<transpktsize>范围)s)+ QICFG : "transwaittm" , (支持的<transwaittm>范围)s)+ QICFG : "dataformat" , (支持的<send_data_format>s列表), (支持的<recv_data_format>s列表)
+ QICFG : "viewmode" , (支持的<view_mode>选项列表)+ QICFG : "tcp/retranscfg" , (支持的<max_backoffs>范围), (支持的<max_rto>范围)
+ QICFG : "dns/cache" , (支持的<DNS_cache>缓存)
+ QICFG : "qisend(timeout)" , (支持的<time>s)
+ QICFG : "passiveclosed" , (支持的<closed>s)
+ QICFG : "tcp/accept" , (支持的<state>s)
+ QICFG : "tcp/keepalive" , (支持的启用选项列表) , (支持的空闲时间范围) , (支持的间隔时间范围) , (支持的探测次数范围)
+ QICFG : "recvind" , (支持的<enable>s)
+ QICFG : "close(mode)" , (支持的<close_mode>选项)+ QICFG : "sendinfo" , (支持的<send_view_mode>选项)+ QICFG : "formatcfg" , (支持的<format>选项)

好的

| Write Command Configure response information format after executing AT+QISEND AT+QICFG="formatcfg"[,<format>] | Response If the parameter is omitted, query the current setting: +QICFG: "formatcfg",<format> OK If the parameter is specified, configure response information format after executing AT+QISEND : OK If there is any error: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | - |
| Characteristic | The commands take effect immediately. The configurations are not saved. |

Parameter

| | |
|---------------------------------|--|
| <transpktsize> | Integer type. The maximum length of the data packet to be sent in transparent transmission mode. Range: 1–1460; Default value: 1024; Unit: byte. |
| <transwaittm> | Integer type. The waiting time before sending the data automatically if the length of data to be sent is less than the value of <transpktsize> in transparent transmission mode. Range: 0–20; Default value: 2; Unit: 100 ms. |
| <send_data_format> | Integer type. The format of the data to be sent. The suffix "0x" is not needed when the mode is set as hex mode, and the module will automatically form two bytes to one ASCII code. 0 Text mode 1 Hex mode |
| <recv_data_format> | Integer type. The format of the data to be received. The suffix "0x" is not needed when the mode is set as hex mode, and the module will automatically form two bytes to one ASCII code. 0 Text mode |

| | |
|--|---|
| 或“TCP传入” AT+ QICFG = “发送信息” [，<发送视图模式>] | 若指定该参数，启用或禁用以返回AT+ QISEND的响应信息（URC格式）： 好的 如存在任何错误： 错误 或 “CME” 错误: <err> |
| 写入命令 执行后配置响应信息格式 AT+QISEND AT+ QICFG = “格式配置” [<format>] | 应答 若省略该参数，请查询当前设置： + QICFG : “formatcfg” , <format> 如果指定该参数，则在执行AT+ QISEND后配置响应信息格式： 好的 如存在任何错误： 错误 或 “CME” 错误: <err> |
| 最大响应时间 | - |
| 特征性的 | 这些指令立即生效。 配置未保存。 |

参数

| | |
|---------------|--|
| <传输数据包大小> | 整数类型。透明传输模式下待发送数据包的最大长度。范围：1–1460；默认值：1024；单位：字节。 |
| <transwaittm> | 整数类型。在透明传输模式下，若待发送数据长度小于transpktsize值时，自动发送数据前的等待时间。范围：0–20；默认值：2；单位：100毫秒。整数类型。 |
| <发送数据格式> | 待发送数据的格式。当模式设置为十六进制模式时，无需使用后缀“0x”，模块将自动将两个字节组合成一个ASCII码。 0 文本模式 1 十六进制模式 |
| <接收数据格式> | 整数类型。待接收数据的格式。当模式设置为十六进制模式时，无需使用后缀“0x”，模块将自动将两个字节组合为一个ASCII码。 0 文本模式 |

| | |
|------------------|---|
| | 1 Hex mode |
| <view_mode> | Integer type. The output format of the received data in non-transparent transmission mode. 0 data header\r\ndata. 1 data header,data. |
| <max_backoffs> | Integer type. The maximum times of TCP retransmission. Range: 3–20; Default value: 8. |
| <max_rto> | Integer type. The maximum interval time of TCP retransmission. Range: 5–1000; Default value: 600; Unit: 100 ms. |
| <DNS_cache> | Integer type. Enable or disable the DNS cache. 0 Enable 1 Disable |
| <time> | Integer type. The timeout value of AT+QISEND . After > is responded, if no data is inputted within the timeout period, AT+QISEND will be exited. Range: 0–3600; Default value: 0; Unit: ms. |
| <closed> | Integer type. Enable or disable the passive close of TCP connection when the server is closed. 0 Disable 1 Enable |
| <state> | Integer type. Enable or disable the automatic reception of the TCP connection from the client. 0 Disable 1 Enable |
| <enable> | Integer type. In AT+QICFG="tcp/keepalive" , it means whether to send TCP keepalive information. In AT+QICFG="recvind" , it configures whether to display the data length in the URC reported by the module after receiving the data in buffer mode. 0 Not send/Not display 1 Send/Display |
| <idle_time> | Integer type. The triggered keepalive cycle time. Range: 1–1800; Default value: 60; Unit: s. |
| <interval_time> | Integer type. The interval of sending packets in a cycle time. Range: 25–100; Default value: 25; Unit: s. |
| <probe_cnt> | Integer type. The times of sending packets in a cycle time. Range: 3–10; Default value: 3. |
| <close_mode> | Integer type. Enable or disable to report response information of AT+QICLOSE in URC format. 0 Disable 1 Enable |
| <send_view_mode> | Integer type. Enable or disable to report response information of AT+QISEND in URC format. 0 Disable 1 Enable |
| <format> | Integer type. The response information format after executing AT+QISEND . |

| | |
|----------------|--|
| | 1 十六进制模式 |
| <视图模式> | 整数类型。非透明传输模式下接收数据的输出格式。 0 数据头\r\ndata。 1 一个数据头，数据。 |
| <max_backoffs> | 整数类型。TCP重传的最大次数。范围：3-20； 默认值：8。 |
| <max_rto> | 整数类型。TCP重传的最大间隔时间。范围：5-1000；默认值：600；单位：100毫秒。 |
| <DNS_缓存> | 整数类型。启用或禁用DNS缓存。 0 启用 1 禁用 |
| 时间 | 整数类型。AT+QISEND的超时值。在>响应后，若超时时间内未输入数据，则AT+QISEND将退出。范围：0-3600；默认值：0；单位：ms。 |
| 封闭 | 整数类型。启用或禁用服务器关闭时TCP连接的被动关闭。 0 禁用 1 启用 |
| 陈述 | 整数类型。启用或禁用从客户端自动接收TCP连接。 0 禁用 1 启用 |
| 使能够 | 整数类型。在AT+QICFG = "tcp/keepalive" 中，表示是否发送TCP keepalive信息。在AT+QICFG = "recvind" 中，配置在缓冲模式下接收数据后，是否显示模块报告的URC数据长度。 0 未发送/未显示 1 发送/显示 |
| <idle_time> | 整数类型。触发的存活周期时间。范围：1-1800；默认值值：60；单位：秒。 |
| <间隔时间> | 整数类型。周期时间内发送数据包的间隔。范围：25-100； 默认值：25；单位：秒。 |
| <探测器计数> | 整数类型。每个周期内发送数据包的次数。范围：3-10； 默认值：3。 |
| <关闭模式> | 整数类型。启用或禁用以报告AT+qiclose的响应信息，格式为URC。 0 禁用 1 启用 |
| <发送查看模式> | 整数类型。启用或禁用以报告AT+QISEND的响应信息，格式为URC。 0 禁用 1 启用 |
| 版式 | 整数类型。执行AT+QISEND后的响应信息格式。 |

S3 is **ATS3** and S4 is **ATS4**.

0 "S3S4"

1 "S3S4>S3S4"

<err>

Integer type. Error codes. For more details, see **chapter 4**.

NOTE

The setting of **AT+QICFG="tcp/retranscfg",<max_backoffs>,<max_rto>** will take effect to all TCP Socket connections and will not be saved to NV.

2.3.2. AT+QICSGP Configure Parameter of TCP/IP Context

This command configures <APN>, <username>, <password> and other parameters of TCP/IP context. The QoS settings can be configured by **AT+CGQMIN**, **AT+CGEQMIN**, **AT+CGQREQ** and **AT+CGQREQ**. For more details about the AT commands, see **document [1]**.

AT+QICSGP Configure Parameters of TCP/IP Context

| | |
|--|---|
| Test Command AT+QICSGP=? | Response: +QICSGP: (range of supported <contextID>s),(range of supported <context_type>s),<APN>,<username>,<password>,(range of supported <authentication>s) OK |
| Write Command Configure the specified context AT+QICSGP=<contextID>[,<context_type>,<APN>[,<username>,<password>,<authentication>]] | Response: If the optional parameters are omitted, query the configuration of specified context: +QICSGP: <context_type>,<APN>,<username>,<password>,<authentication> OK If the optional parameters are specified, configure the specified context: OK If there is any error: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | - |
| Characteristics | The command takes effect immediately. |

S3是ATS3，S4是ATS4。

```
0 "S3S4"
1 "S3S4>S3S4"
```

<err>

整数类型。错误代码。有关详细信息，请参阅第4章。

注释

AT+QICFG= "tcp/retranscfg" [, <max_backoffs>, <max_rto>]的设置将对所有TCP套接字连接生效，且不会保存至NV。

2.3.2. TCP/IP上下文的AT+ QICSGP 配置参数

此命令配置<APN>、<username>、<password>及TCP/IP环境的其他参数。QoS设置可通过AT+ CGQMIN、AT+cgeqmin、AT+ CGQREQ和AT+ CGQREQ进行配置。有关AT命令的更多详细信息，请参阅文档[1]。

AT+ QICSGP 配置TCP/IP上下文参数

| | |
|--|--|
| 测试命令 AT+QICSGP=? | 应答: + QICSGP : (支持的范围<contextID>s), (支持的范围<context_type>s), < APN >, <username>, <password>, (支持的范围<authentication>s) 好的 |
| 写入命令 配置指定上下文 AT+ QICSGP=<contextID>[<context_type>, <APN>[<username>, <password>, <authentication>]] | 应答: 若省略可选参数，则查询指定上下文的配置： + QICSGP : <context_type>, < APN >, <username>, <password>, <authentication> 好的 若指定可选参数，请配置指定上下文： 好的 如存在任何错误： 错误 或 “CME” 错误: <err> |
| 最大响应时间 | - |
| 特征 | 该命令立即生效。 |

| | |
|--|-----------------------------------|
| | The configurations are not saved. |
|--|-----------------------------------|

Parameter

| | |
|-------------------------------|---|
| <contextID> | Integer type. The PDP context ID. Range: 1–5. |
| <context_type> | Integer type. The protocol type. 1 IPv4 2 IPv6 3 IPv4v6 |
| <APN> | String type. Access point name. |
| <username> | String type. Username. Maximum length: 127; Unit: byte. |
| <password> | String type. Password. Maximum length: 127; Unit: byte. |
| <authentication> | Integer type. APN authentication methods. 0 None 1 PAP 2 CHAP 3 PAP or CHAP |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

Example

```
AT+QICSGP=1 //Query the configuration of context 1.
+QICSGP: 1,"","","","",0

OK
AT+QICSGP=1,1,"UNINET","","","",0 //Configure context 1. APN is configured as "UNINET"
(China Unicom).
OK
```

2.3.3. AT+QIACT Activate PDP Context

Before activating PDP context by **AT+QIACT**, the context should be configured by **AT+QICSGP**. After activation, the IP address can be queried by **AT+QIACT?**.

The range of **<contextID>** is 1–5. Module supports up to 5 PDP contexts activated simultaneously. Depending on the network, it may take at most 150 s to return **OK** or **ERROR** after **AT+QIACT** is executed. Before the response is returned, other AT commands cannot be executed.

AT+QIACT Activate PDP Context

| | |
|-------------------|--|
| Test Command | Response: |
| AT+QIACT=? | +QIACT: (range of supported <contextID>s) |

| | |
|--|--------|
| | 配置未保存。 |
|--|--------|

参数

| | |
|--------------------|---------------------------|
| 情境ID | 整数类型。PDP上下文ID。范围：1-5。 |
| 类型> | 整数类型。协议类型。 |
| 1 | IPv4 |
| 2 | IPv6 |
| 3 | IPv4v6 |
| <APN> | 字符串类型。接入点名称。 |
| <用户名> | 字符串类型。用户名。最大长度：127；单位：字节。 |
| <密码> | 字符串类型。密码。最大长度：127；单位：字节。 |
| 证明 | 整数类型。APN认证方法。 |
| 0 | 没有一个 |
| 1 | PAP |
| 2 | CHAP |
| 3 | PAP或CHAP |
| <err> | 整数类型。错误代码。有关详细信息，请参阅第4章。 |

样例

```
AT+QICSGP=1                                //查询上下文1的配置
+QICSGP: 1, "", "", "", 0

好的
AT+QICSGP=1, "联通", "", 0                //配置上下文 1. APN 已配置为 "UNINET"
                                              中国联通
好的
```

2.3.3. AT+ QIACT 激活PDP上下文

在通过AT+ QIACT激活PDP上下文之前，上下文应通过AT+ QICSGP进行配置。激活后，可通过AT+ QIACT查询IP地址。

contextID的范围是 1-5。模块最多支持同时激活 5 个 PDP 上下文。根据网络情况，执行AT+ QIACT后返回**OK**或**error**的时间最多为 150 秒。在返回响应之前，不能执行其他 AT 命令。

AT+ QIACT 激活PDP上下文

| | |
|--------------------|--------------------------------------|
| 测试命令 AT+QIACT=? | 应答： +QIACT : (支持的 <contextID> 范围) |
|--------------------|--------------------------------------|

| <IPv6_address> | String type. Local IPv6 address after the context is activated. |
| <err> | Integer type. Error codes. For more details, see Chapter 4 . |

2.3.4. AT+QIDEACT Deactivate PDP Context

This command deactivates specified context and closes all TCP/IP connections set up in this context. Depending on the network, it may take at most 40 s to return **OK** or **ERROR** after executing **AT+QIDEACT**. Before the response is returned, other AT commands cannot be executed.

AT+QIDEACT Deactivate PDP Context

| | |
|--|--|
| Test Command AT+QIDEACT=? | Response: +QIDEACT: (range of supported <contextID>s) OK |
| Write Command AT+QIDEACT=<contextID> | Response: OK If there is any error: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | 40 seconds, determined by network. |
| Characteristics | - |

Parameter

| | |
|--------------------------|---|
| <contextID> | Integer type. The PDP context ID. Range: 1–5. |
| <err> | Integer type. Error codes. See Chapter 4 . |

2.3.5. AT+QIACTEX Activate PDP Context Asynchronously

This command activates specified PDP context asynchronously. Before activating specified PDP context by **AT+QIACTEX**, the context should be configured by **AT+QICSGP**. After activation, the IP address can be queried by **AT+QIACTEX?**.

The range of **<contextID>** is 1–5. Module supports up to 5 PDP contexts activated simultaneously. The

| | |
|----------------|--------------------------|
| 1 | IPv4 |
| 2 | IPv6 |
| 3 | IPv4v6 |
| <IPv4_address> | 字符串类型。启用上下文后显示的本地IPv4地址。 |
| <IPv6_address> | 字符串类型。启用上下文后显示的本地IPv6地址。 |
| <err> | 整数类型。错误代码。有关详细信息，请参阅第4章。 |

2.3.4. AT+qideact PDP上下文的去激活

此命令将停用指定上下文并关闭在此上下文中建立的所有TCP/IP连接。根据网络情况，执行AT+qideact后最多需要40秒返回OK或error。在返回响应之前，无法执行其他AT命令。

AT+qideact PDP上下文的去激活

| | |
|---|---|
| 测试命令 AT+QIDEACT=? | 应答: +qideact: (支持的 <contextID> 范围) 好的 |
| 写入命令 AT+qideact=<contextID> | 应答: 好的 如存在任何错误: 错误 或 “CME” 错误: <err> |
| 最大响应时间 | 40秒，由网络决定。 |
| 特征 | - |

参数

<contextID> 整数类型。PDP上下文ID。范围：1-5。

<err> 整数类型。错误代码。请参阅第4章。

2.3.5. AT+qiactex异步激活PDP上下文

此命令异步激活指定的PDP上下文。在通过AT+qiactex激活指定的PDP上下文之前，应通过AT+ QICSGP配置上下文。激活后，可通过AT+qiactex? 查询IP地址。

contextID的取值范围为1-5。该模块最多可同时激活5个PDP上下文。

number of PDP context activated simultaneously actually depends on (U)SIM card. The module returns **OK** or **ERROR** after executing **AT+QIACTEX**. After that, the result is reported by URC **+QIACTEX**.

AT+QIACTEX Activate PDP Context Asynchronously

| | |
|--|--|
| Test Command AT+QIACTEX=? | Response: +QIACTEX: (range of supported <contextID>s), (list of supported <view_mode>s) OK |
| Read Command AT+QIACTEX? | Response: Return the list of all activated PDP contexts and corresponding IP addresses: If <context_type>=1 +QIACTEX: 1,<context_state>,1,<IPv4_address> [...] +QIACTEX: 5,<context_state>,1,<IPv4_address> Or <context_type>=2 +QIACTEX: 1,<context_state>,2,<IPv6_address> [...] +QIACTEX: 5,<context_state>,2,<IPv6_address> Or <context_type>=3 +QIACTEX: 1,<context_state>,3,<IPv4_address>,<IPv6_address> [...] +QIACTEX: 5,<context_state>,3,<IPv4_address>,<IPv6_address> OK |
| Write Command AT+QIACTEX=<contextID>[,<view_mode>] | Response: If <view_mode>=0: OK +QIACTEX: <contextID>,<err> If <view_mode>=1: OK +QIACTEX: <contextID>,<err>[,1,<IPv4_address>] Or +QIACTEX: <contextID>,<err>[,2,<IPv6_address>] Or |

实际同时激活的PDP上下文数量取决于(U)SIM卡。该模块在执行AT+qiactex后返回**OK**或**error**。之后，结果由URC+qiactex报告。

AT+qiactex异步激活PDP上下文

| | |
|--|--|
| 测试命令 AT+QIACTEX=? | 应答: +qiactex: (支持的 <contextID> 范围), (列表 支持 <view_mode> 好的 |
| 读命令 AT+QIACTEX® | 应答: 返回所有已激活PDP上下文及其对应IP地址的列表: 如果<context_type>=1 +qiactex: 1, <context_state>, 1, <IPv4_address>[... +qiactex: 5, <context_state>, 1, <IPv4_address>] 或<context_type>=2 +qiactex: 1, <context_state>, 2, <IPv6_address>[... +qiactex: 5, <context_state>, 2, <IPv6_address>] 或<context_type>=3 +QIACTEX: 1,<context_state>,3,<IPv4_address>,<IPv6_address> [... +qiactex: 5, <context_state>, 3, <IPv4_address>, <IPv6_address>] 好的 |
| 写入命令 AT+qiactex=<contextID>[, <view_mode>] | 应答: 如果<view_mode>=0: 好的 +QIACTEX: <contextID>,<err> 如果<view_mode>=1: 好的 +qiactex: <contextID>, <err>[, 1, <IPv4_address>] 或 +qiactex: <contextID>, <err>[, 2, <IPv6_address>] 或 |

| | |
|-----------------------|---|
| | <p>+QIACTEX: <contextID>,<err>[,3,<IPv4_address>,<IPv6_address>]</p> <p>If there is any error: ERROR Or +CME ERROR: <err></p> |
| Maximum Response Time | 150 seconds, determined by network. |
| Characteristics | - |

Parameter

| | |
|------------------------------|---|
| <contextID> | Integer type. The PDP context ID. Range: 1–5. |
| <view_mode> | Integer type. Whether to display IP address and type. 0 Not display 1 Display |
| <context_state> | Integer type. The PDP context state. 0 Deactivated 1 Activated |
| <context_type> | Integer type. Protocol type. 1 IPv4 2 IPv6 3 IPv4v6 |
| <IPv4_address> | String type. Local IPv4 address of the activated context. |
| <IPv6_address> | String type. Local IPv6 address of the activated context. |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

2.3.6. AT+QIDEACTEX Deactivate PDP Context Asynchronously

This command deactivates PDP context asynchronously. After executing **AT+QIDEACTEX**, the module returns **OK** or **ERROR**. After that, the result of PDP context is reported by URC **+QIDEACTEX**.

| AT+QIDEACTEX Deactivate PDP Context Asynchronously | |
|---|--|
| Test Command AT+QIDEACTEX=? | Response: +QIDEACTEX: (range of supported <contextID>s) OK |
| Write Command AT+QIDEACTEX=<contextID> | Response: OK |

| | |
|--------|--|
| | +qiactex: <contextID>, <err>[, 3, < IPv4_address >, < IPv6_address>] |
| | 如存在任何错误: 错误 或 “CME” 错误: <err> |
| 最大响应时间 | 150秒，由网络决定。 |
| 特征 | - |

参数

| | |
|----------------|--|
| 情境ID | 整数类型。PDP上下文ID。范围: 1-5。 |
| <视图模式> | 整数类型。是否显示IP地址及类型。 0 不显示 1 显示 |
| 状态_ | 整数类型。PDP上下文状态。 0 失活 1 已激活 |
| 类型> | 整数类型。协议类型。 1 IPv4 2 IPv6 3 IPv4v6 |
| <IPv4_address> | 字符串类型。激活上下文的本地IPv4地址。 |
| <IPv6_address> | 字符串类型。激活上下文的本地IPv6地址。整数类型。错误代码。有关 |
| <err> | 详细信息，请参阅第4章。 |

2.3.6. AT+qideactex异步停用PDP上下文

该命令异步停用PDP上下文。执行AT+qideactex后，模块返回OK或error。之后，PDP上下文的结果由URC+qideactex报告。

| AT+QIDEACTEX 停用PDP | | 上下文异步 |
|----------------------------------|----|--|
| 测试命令 AT+QIDEACTEX=? | | 应答: +qideactex: (支持的范围<contextID>s) 好的 |
| 写入命令 AT+qideactex=<contextID> | 好的 | 应答: |

| | |
|-----------------------|--|
| | +QIDEACTEX: <contextID>,<err> If there is any error: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | 40 seconds, determined by network. |
| Characteristics | - |

Parameter

- <contextID>** Integer type. The PDP context ID. Range: 1–5.
<err> Integer type. Error codes. For more details, see **chapter 4**.

2.3.7. AT+QIOPEN Open Socket Service

This command opens socket service. The service type can be specified by **<service_type>**. The data access mode (buffer access mode, direct push mode and transparent transmission mode) can be specified by **<access_mode>**. The URC **+QIOPEN** indicates whether the socket service has been opened successfully.

1. If **<service_type>="TCP LISTENER"**, the module works as TCP server. After accepting a new TCP connection, the module automatically specifies a **<connectID>** and reports a URC **+QIURC: "incoming",<connectID>,<serverID>,<remoteIP>,<remote_port>**. The range of **<connectID>** is 0–11. The type of this new TCP connection is "TCP INCOMING" and the value of **<access_mode>** is the same with that of **<access_mode>** of "TCP LISTENER".
2. If **<service_type>="UDP SERVICE"**, UDP data can be sent to or received from the remote IP through **<local_port>**.
 - Send data: execute **AT+QISEND=<connectID>,<send_length>,<remoteIP>,<remote_port>**.
 - Receive data in direct push mode: the module reports the URC **+QIURC: "recv",<connectID>,<currentrecvlength>,<remoteIP>,<remote_port><CR><LF><data>**.
 - Receive data in buffer access mode: the module reports the URC **+QIURC: "recv",<connectID>**, and then data can be read by user by **AT+QIRD=<connectID>**.

It is suggested to wait for 150 seconds for the URC **+QIOPEN: <connectID>,<err>** to be outputted after the command is executed. If the URC cannot be received in 150 seconds, **AT+QICLOSE** should be used to close the socket.

| | |
|--------|--|
| | +QIDEACTEX: <contextID>,<err> |
| | 如存在任何错误: 错误 或 “CME” 错误: <err> |
| 最大响应时间 | 40秒，由网络决定。 |
| 特征 | - |

参数

<contextID>整数类型。PDP上下文ID。范围: 1-5。

<err> 整数类型。错误代码。有关详细信息，请参阅[第4章](#)。

2.3.7. AT+QIOPEN 开放套接字服务

该命令打开套接字服务。服务类型可通过<service_type>指定。数据访问模式（缓冲区访问模式、直接推送模式和透明传输模式）可通过<access_mode>指定。URC +QIOPEN表示套接字服务是否已成功打开。

- 如果 <service_type>= “TCP listener” , 该模块作为TCP服务器运行。在接收新TCP连接后，模块会自动指定一个 <connectID> 并报告一个URC +QIURC: “incoming” , <connectID>, <serverID>, <remoteIP>, <remote_port>。<connectID>的取值范围为0-11。此新TCP连接的类型为 “TCP incoming” , 且 <access_mode>的值与 <access_mode> “TCP listener” 的值相同。
- 如果<service_type>= “UDP服务” , 则UDP数据可以通过<local_port>发送或接收来自远程IP的数据。
 - 发送数据：执行AT+QISEND=<connectID>, <send_length>, <remoteIP>, <remote_port>.
 - 以直接推送模式接收数据：该模块报告URC+QIURC: “recv” , <connectID>, <currentrecvlength>, <remoteIP>, <remote_port><CR><LF><data>.
 - 以缓冲区访问模式接收数据：模块报告URC +QIURC : “recv” , <connectID>, 然后用户可以通过AT+QIRD =<connectID>读取数据。

建议在执行命令后等待150秒，以输出URC +QIOPEN : <connectID>, <err>。如果在150秒内无法收到URC，则应使用AT+qiclose关闭套接字。

AT+QIOPEN Open Socket Service

| | |
|---|--|
| Test Command AT+QIOPEN=? | Response +QIOPEN: (range of supported <contextID>s),(range of supported <connectID>s),(list of supported <service_type>s),<address_string>,(range of supported <remote_port>s),(range of supported <local_port>s),(range of supported <access_mode>s),(range of supported <TCP_client_maxnum>s),(range of supported <connect_timeout>s) |

| TCP监听器: 启动TCP服务器监听TCP连接; UDP服务: 启动UDP服务 <地址字符串> | 字符串类型。远程服务器的IP地址或域名。可以是 |

| | |
|---------------------|---|
| | set as <IP_address> or <domain_name>. |
| <IP_address> | String type. If <service_type>="TCP" or "UDP", it indicates the IP address of the remote server, such as "220.180.239.212". If <service_type>="TCP LISTENER" or "UDP SERVICE", input "127.0.0.1". |
| <domain_name> | String type. The domain name address of the remote server. Maximum length: 256; Unit: byte. |
| <remote_port> | Integer type. The port of the remote server. Range: 0–65535. If <service_type>="TCP" or "UDP", the port must be specified. If <service_type>="TCP LISTENER" or "UDP SERVICE", set it as 0. |
| <local_port> | Integer type. Local port. Range: 0–65535. If <service_type>="TCP" or "UDP", the local port will be assigned automatically if it is set as 0. Otherwise, the local port will be specified. If <service_type>="TCP LISTENER" or "UDP SERVICE", the port number must be specified. |
| <access_mode> | Integer type. The data access mode of the socket service. 0 Buffer access mode 1 Direct push mode 2 Transparent transmission mode |
| <TCP_client_maxnum> | Integer type. <TCP_client_maxnum> is valid only when <service_type>="TCP LISTENER" and it can control the maximum number of client connection. Range: 0–11; Default value: 11. |
| <connect_timeout> | Integer type. Reconnection timeout value. Range: 10–150; Default value: 0; Unit: s. The reconnection is not enabled by default. |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

NOTE

1. It is suggested to wait for 150 seconds for the URC +QIOPEN: <connectID>,<err> to be outputted.
2. You need to close socket service by executing **AT+QICLOSE=<connectID>** if the connection failed.
3. If the module works as the server, you need to configure the call mode as the router mode or the bridge mode by executing **AT+QCFG="nat",1** or **AT+QCFG="nat",2**. For more details about the command, see **document [1]**.

2.3.8. AT+QICLOSE Close Socket Service

This command closes specified socket service. Depending on the network, it will take at most 10 seconds (default value, it can be modified by <timeout>) to return **OK** or **ERROR** after **AT+QICLOSE** is executed. Before the response is returned, other AT commands cannot be executed.

| | |
|-------------|---|
| | 设置为<IP_address>或<domain_name>。 |
| IP地址 | 字符串类型。 如果<service_type>= “TCP” 或 “UDP”， 则表示远程服务器的IP地址， 例如 “220.180.239.212”。 如果<service_type>是 “TCP监听器” 或 “UDP服务”， 则输入 “127.0.0.1”。 |
| | <domain_name>字符串类型。远程的域名地址 服务器。最大长度：256；单位：字节。整数 |
| <远程端口> | 类型。远程服务器的端口。范围：0-65535。 如果<service_type>= “TCP” 或 “UDP”， 则必须指定端口。 如果 <service_type>是 “TCP listener” 或 “UDP service”， 则将其设置为 0。 |
| <本地端口> | 整数类型。本地端口。范围：0-65535。 如果 <service_type>= “TCP” 或 “UDP”， 则如果本地端口设置为0， 将自动分配本地端口。否则， 将指定本地端口。如果 <service_type>= “TCP监听程序” 或 “UDP服务”， 则必须指定端口号。 |
| <访问模式> | 整数类型。套接字服务的数据访问模式。 0 缓冲存取方式 1 直接推送模式 2 透明传输模式 |
| <TCP客户端最大数> | 整数类型。<TCP_client_maxnum>仅当 <service_type>为 “TCP listener” 时有效， 用于控制客户端连接的最大数量。范围：0-11；默认值：11。 |
| <连接超时> | 整数类型。重连超时值。范围：10-150；默认值：0； 单位：秒。默认情况下未启用重新连接功能。 |
| <err> | 整数类型。错误代码。有关详细信息，请参阅第4章。 |

注释

- ^ 建议等待150秒，直到URC +QIOPEN :<connectID>, <err>输出完毕。
- ~ 如果连接失败，您需要通过执行AT+qiclose=<connectID>来关闭套接字服务。
- 3. 如果模块作为服务器工作，则需要通过执行AT+ QCFG = “nat” , 1或AT+ QCFG = “nat” , 2将呼叫模式配置为路由器模式或桥接模式。有关此命令的更多详细信息，请参阅文档[1]。

2.3.8. AT+QICLOSE关闭套接字服务

此命令关闭指定的套接字服务。根据网络情况，执行AT+qiclose后最多需要10秒（默认值，可通过timeo-ut修改）返回**OK**或**error**。在返回响应之前，无法执行其他AT命令。

AT+QICLOSE Close Socket Service

| | |
|--|--|
| Test Command AT+QICLOSE=? | Response: +QICLOSE: (range of supported <connectID>s),(range of supported <timeout>s) OK |
| Write Command AT+QICLOSE=<connectID>[,<timeout>] | Response: If <close_mode>=0 (AT+QICFG="close	mode"): Close successfully: OK Fail to close: ERROR If <close_mode>=1 (AT+QICFG="close	mode"): Close successfully: OK +QIURC: "closed",<connectID> Fail to close: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | Default value: 10 s, determined by <timeout>. |
| Characteristics | - |

Parameter

| | |
|--------------------------|---|
| <contextID> | Integer type. The Socket ID. Range: 0–11. |
| <timeout> | Integer type. Timeout value for the response to be outputted. If the FIN ACK of other clients is not received within <timeout>, the module will be forced to close the socket. Range: 0–65535; Default value: 10; Unit: second. |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

2.3.9. AT+QISTATE Query Socket Service Status

This command queries the socket service status. If <query_type>=0, it will return the status of all existing socket services in the specified context. If <query_type>=1, it will return the status of a specified socket service.

| AT+QICClose关闭套接字服务 | |
|--|--|
| 测试命令 AT+QICCLOSE=? | 应答: +qiclose: (支持的 <connectID> 范围), (支持的 <timeout> 范围) 好的 |
| 写入命令 AT+qiclose=<连接ID>[, 超时时间] | 应答: 如果<close_mode>=0 (AT+ QICFG = "close	mode"):关闭 成功: 好的 未能关闭: 错误 如果<close_mode>=1 (AT+ QICFG = "close	mode"):关闭 成功: 好的 + QIURC : "已关闭" , <connectID> 未能关闭: 错误 或 "CME" 错误: <err> |
| 最大响应时间 | 默认值: 10 秒, 由 <timeout> 确定。 |
| 特征 | - |

参数

| | |
|----------|--|
| 情境ID<超时> | 整数类型。套接字ID。范围: 0-11。 整数类型。用于输出响应的超时值。若在<timeout>内未收到其他客户端的FIN ACK, 模块将强制关闭套接字。范围: 0-65535; 默认值: 10; 单位: 秒。 |
| <err> | 整数类型。错误代码。有关详细信息, 请参阅第4章。 |

2.3.9. AT+Q状态查询套接字服务状态

此命令查询套接字服务状态。如果 <query_type>=0, 它将返回指定上下文中所有现有套接字服务的状态。如果 <query_type>=1, 它将返回指定套接字服务的状态。

AT+QISTATE Query Socket Service Status

| | |
|--|---|
| Test Command AT+QISTATE=? | Response: +QISTATE: (list of supported <query_type>s),(range of supported <contextID>s),(range of supported <connectID>s) OK |
| Read Command/Execution Command AT+QISTATE? Or AT+QISTATE | Response: Return the status of all existing socket services: +QISTATE: <connectID>,<service_type>,<IP_address>,<remote_port>,<local_port>,<socket_state>,<contextID>,<serverID>,<access_mode>,<AT_port> [...] OK |
| Write Command If <query_type>=0, query the status of all socket services in a specified context AT+QISTATE=<query_type>,<contextID> | Response: Return the status of all existing socket service in a specified context +QISTATE: <connectID>,<service_type>,<IP_address>,<remote_port>,<local_port>,<socket_state>,<contextID>,<serverID>,<access_mode>,<AT_port> [...] OK If there is any error: ERROR Or +CME ERROR: <err> |
| Write Command If <query_type>=1, query the status of specified socket service AT+QISTATE=<query_type>,<connectID> | Response: Return the status of specified socket service: +QISTATE: <connectID>,<service_type>,<IP_address>,<remote_port>,<local_port>,<socket_state>,<contextID>,<serverID>,<access_mode>,<AT_port> OK If there is any error: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | 300 ms |

| AT+Q状态查询套接字服务状态 | |
|--|---|
| 测试命令 AT+Q状态=? | 应答: +qistate: (支持的 <query_type>类型列表), (支持的 <contextID>范围), (支持的 <connectID>范围) 好的 |

| 写入命令 如果 <query_type>=0, 查询指定上下文 AT+qistate=<query_type>, <context ID>中所有套接字服务的状态 | 应答: 返回指定上下文中所有现有套接字服务的状态 +qistate: <连接ID>, <服务类型>, <IP地址>, <remote_port>, <local_port>, <socket_state>, <contextID>, <服务器ID>, <访问模式>, <AT端口> [...] 好的 如存在任何错误: 错误 或 “CME” 错误: <err> |
| 写入命令 如果 <query_type>=1, 查询指定套接字服务的状态 AT+qistate=<query_type>, <connectID> | 应答: 返回指定套接字服务的状态: +qistate: <连接ID>, <服务类型>, <IP地址>, <remote_port>, <local_port>, <socket_state>, <contextID>, <服务器ID>, <访问模式>, <AT端口> 好的 如存在任何错误: 错误 或 “CME” 错误: <err> |
| 最大响应时间 | 300毫秒 |

Characteristics

-

Parameter

| | |
|--|--|
| <query_type> | Integer type. The query type. |
| 0 | Query connection status of all existing socket services in a specified context |
| 1 | Query connection status of a specified socket service |
| <contextID> | Integer type. The PDP context ID. Range: 1–5. |
| <connectID> | Integer type. Socket ID. Range: 0–11. |
| <service_type> | String type. The socket service type. |
| "TCP" | Start a TCP connection as a client |
| "UDP" | Start a UDP connection as a client |
| "TCP LISTENER" | Start a TCP server to listen to TCP connection |
| "TCP INCOMING" | Start a TCP connection accepted by a TCP server |
| "UDP SERVICE" | Start a UDP service |
| <IP_address> | String type. IP address. |
| If <service_type> ="TCP" or "UDP", | it is the IP address of remote server. |
| If <service_type> ="TCP LISTENER" or "UDP SERVICE", | it is the local IP address. |
| If <service_type> ="TCP INCOMING", | it is the IP address of remote client. |
| <remote_port> | Integer type. Remote port number. Range: 1–65535. |
| If <service_type> ="TCP" or "UDP", | it is the port of remote server. |
| If <service_type> ="TCP LISTENER" or "UDP SERVICE", | <remote_port> is 0 and the port is invalid. |
| If <service_type> ="TCP INCOMING", | it is the port of remote client. |
| <local_port> | Integer type. Local port number. Range: 0–65535. |
| If <local_port> is 0, | the local port is assigned automatically. |
| <socket_state> | Integer type. The socket service status. |
| 0 | "Initial": connection has not been established |
| 1 | "Opening": client is connecting or server is trying to listen |
| 2 | "Connected": client connection has been established |
| 3 | "Listening": server is listening |
| 4 | "Closing": connection is closed |
| <serverID> | Integer type. It is valid only when <service_type> ="TCP INCOMING". <serverID> indicates the server that accepts this TCP connection, and the value is the same as that of <connectID> of this server's "TCP LISTENER". |
| <access_mode> | Integer type. Data access mode. |
| 0 | Buffer access mode |
| 1 | Direct push mode |
| 2 | Transparent transmission mode |
| <AT_port> | String type. COM port of socket service. |
| "usbmodem" | USB modem port |
| "usbat" | USB AT port |
| "uart1" | UART port 1 |

特征

-

参数

<query_type>整数类型。查询类型。

- 0 查询指定上下文中所有现有套接字服务的连接状态
- 1 查询指定套接字服务的连接状态 <contextID>整数类型。PDP上

下文ID。范围：1–5。

<connectID>整数类型。Socket ID。范围：0–11。

<service_type>字符串类型。套接字服务类型。

| | |
|----------------|------------------|
| 行车调度台 | 以客户端身份建立TCP连接 |
| UDP | 以客户端身份建立UDP连接 |
| TCP监听程序 | 启动TCP服务器监听TCP连接 |
| "TCP incoming" | 指TCP服务器已接受的TCP连接 |
| UDP服务启动 | |

IP_address字符串类型。IP地址。

如果<service_type>= "TCP" 或 "UDP"，则为远程服务器的IP地址。

若服务类型为 "TCP监听器" 或 "UDP服务"，则为本地IP地址。

如果 <service_type>= "TCP incoming"，则为远程客户端的 IP 地址。<remote_port>

整数类型。远程端口号。范围：1–65535。

如果<service_type>= "TCP" 或 "UDP"，则为远程服务器的端口。

如果 <service_type>= "TCP listener" 或 "UDP service"，则<remote_port>为 0，且端口无效。

如果<service_type>= "TCP incoming"，则为远程客户端的端口。

local_port整数类型。本地端口号。范围：0–65535。

如果 <local_port>为 0，则自动分配本地端口。

<socket_state>整数类型。套接字服务状态。

| | |
|---|------------------------|
| 0 | "初始" : 连接尚未建立 |
| 1 | "开启" : 客户端正在连接或服务器正在监听 |
| 2 | "已连接" : 客户端连接已建立 |
| 3 | "监听" : 服务器正在监听 |
| 4 | "关闭" : 连接已关闭 |

<serverID>整数类型。仅当 <service_type>= "TCP incoming" 时有效。<serverID>

表示接受此TCP连接的服务器，其值与该服务器 "TCP监听器" 的<connectID>相同。

access_mode整数类型。数据访问模式。

| | |
|---|----------------------------------|
| 0 | 缓冲存取方式 |
| 1 | 直接推送模式 |
| 2 | 透明传输模式 <AT_port> 字符串类型。套接字服 |

务的COM端口。

| | |
|----------|------------|
| USB调制解调器 | USB调制解调器端口 |
| "usbat" | USB AT端口 |
| "uart1" | UART端口1 |

| | |
|-------|---|
| <err> | Integer type. Error codes. For more details, see chapter 4 . |
|-------|---|

2.3.10. AT+QISEND Send Data

This command sends Socket data in string type through the specified connection. If the data access mode of a specified socket service is buffer access mode (`<access_mode>=0`) or direct push mode (`<access_mode>=1`), the data can be sent by **AT+QISEND**. When the data is sent successfully, **SEND OK** will be returned. Otherwise, **SEND FAIL** or **ERROR** is returned.

- **SEND FAIL** indicates the sending buffer is full and resending of the data can be tried.
- **ERROR** indicates an error arises in the process of sending data. You should resend the data after a certain period of time. The maximum length is 1460 bytes.
- **SEND OK** does not mean the data has been sent to the server successfully. You can query whether the data has reached the server by executing **AT+QISEND=<connectID>,0**.

AT+QISEND Send Data

| | |
|--|---|
| Test Command AT+QISEND=? | Response: +QISEND: (range of supported <connectID>s),(range of supported <send_length>s),<remoteIP>,(range of supported <remote_port>s) OK |
| Write Command Send variable-length data when <service_type>="TCP", "UDP" or "TCP INCOMING" AT+QISEND=<connectID> | Response: > After the response > , input the data to be sent. Tap Ctrl + Z to send and tap Esc to cancel the operation If <code><send_view_mode>=0 (AT+QICFG="sendinfo")</code> : If the connection has been established and the data is sent to the module successfully: SEND OK If the connection has been established but the sending buffer is full: SEND FAIL If there is any error: ERROR Or +CME ERROR: <err> If <code><send_view_mode>=1 (AT+QICFG="sendinfo")</code> : |

<err> 整数类型。错误代码。有关详细信息，请参阅第4章。

2.3.10. AT+ QISEND 发送数据

该命令通过指定连接发送字符串类型的Socket数据。若指定Socket服务的数据访问模式为缓冲区访问模式（**access_mode=0**）或直接推送模式（**access_mode=1**），则可通过**AT+ QISEND**发送数据。当数据成功发送时，将返回**SEND OK**；否则返回**SEND FAIL**或**error**。

- **SEND FAIL**表示发送缓冲区已满，可尝试重新发送数据。
- **error**表示在发送数据的过程中出现错误。应在一段时间后重新发送数据。最大长度为 1460 字节。
- **SEND OK**不表示数据已成功发送到服务器。可通过执行**AT+ QISEND =<connectID>, 0**查询数据是否已到达服务器。

AT+ QISEND 发送数据

| | |
|---|--|
| 测试命令 AT+QISEND=? | 应答: +QISEND : (支持的 <connectID> 范围), (支持的 <send_length> 范围), <remoteIP>, (范围 支持 <remote_port> |

| 最大响应时间 | - |
| 特征 | - |

参数

| | |
|------------|--|
| <连接ID> | 整数类型。套接字ID。范围： 0-11。 |
| <发送长度> | 整数类型。待发送数据的长度。范围： 0-1460； 单位：字节。 |
| <remoteIP> | 字符串类型。远程IP地址（必须采用点分十进制格式）。仅当service_type= “UDP服务” 时有效。 |
| <远程端口> | 整数类型。远程端口。范围： 1-65535。仅当<service_type>= “UDP服务” 时有效。 |
| <发送总长度> | 整数类型。发送数据的总长度。单位：字节。 |
| <ack> | 整数类型。接收数据的总长度。单位：字节。 |
| 未确认字节 | 整数类型。未接收数据的总长度。单位：字节。 |
| 社会地位 | 整数类型。 |

| | |
|-------------|--|
| | 0 The data is sent to socket buffer successfully 1 The received buffer is full and fail to send |
| <free_size> | Integer type. The remaining space of the current buffer area. Range: 0–10240; Unit: byte. |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

2.3.11. AT+QIRD Read Received TCP/IP Data

In buffer access mode, module buffers data after receiving it and reports **+QIURC: "recv",<connectID>**, and then the data can be read by **AT+QIRD**.

Please note that if the buffer is not empty, when the module receives data again, it will not report a new URC until all the received data has been read.

| AT+QIRD Read Received TCP/IP Data | |
|--|--|
| Test Command AT+QIRD=? | Response: +QIRD: (range of supported <connectID>s),(range of supported <read_length>s) OK |
| Write Command When <service_type>="TCP"、"UDP" or "TCP INCOMING" AT+QIRD=<connectID>[,<read_length>] | Response: If the specified connection has received the data: +QIRD: <read_actual_length><CR><LF><data> OK If there is no data: +QIRD: 0 OK If there is any error: ERROR Or +CME ERROR: <err> |
| Write Command When <service_type>="UDP SERVICE" AT+QIRD=<connectID> | Response: If data exists: +QIRD: <read_actual_length>,<remoteIP>,<remote_port><CR><LF><data> OK If there is no data: |

| | |
|--------|--------------------------------------|
| | 0 数据已成功发送至套接字缓冲区 1 接收缓冲区已满，发送失败 |
| <自由尺寸> | 整数类型。当前缓冲区剩余空间。范围：0-10240; 单位：字节。 |
| <err> | 整数类型。错误代码。有关详细信息，请参阅第4章。 |

2.3.11. AT+ QIRD 读取接收的TCP/IP数据

在缓冲区访问模式下，模块在接收数据后进行缓冲，并报告QIURC：“recv”，<connectID>，然后数据可以被AT+ QIRD 读取。

请注意，若缓冲区未清空，当模块再次接收数据时，需待所有接收数据读取完毕后，才会报告新的URC。

| AT+ QIRD读取接收的 TCP/IP 数据 | |
|---|---|
| 测试命令 AT+QIRD=? | 应答: +QIRD : (支持的 <connectID> 范围), (支持的 <read_length> 范围) |
| | 好的 |
| 写入命令 当 <service_type>= "TCP" 、 "UDP" 或 "TCP incoming" AT+ QIRD =<co- nnectID>[, <read_length>] | 应答: 若指定连接已接收数据: +QIRD: <read_actual_length><CR><LF><data> |
| | 好的 |
| | 若无数据: +QIRD: 0 |
| | 好的 |
| | 如存在任何错误: 错误 或 "CME" 错误: <err> |
| 写入命令 当 <service_type>= "UDP 服务" AT+ QIRD =<连接ID> | 应答: 若存在数据: + QIRD : <read_actual_length>, <remoteIP>, <remote_port>< CR><LF><data> |
| | 好的 |
| | 若无数据: |

| | |
|--|---|
| | <p>+QIRD: 0</p> <p>OK</p> <p>If there is any error: ERROR Or +CME ERROR: <err></p> |
| Write Command When <read_length> =0, query the data that has been read AT+QIRD=<connectID>,0 | <p>Response:</p> <p>If the specified connection exists: +QIRD: <total_receive_length>,<have_read_length>,<unread_length></p> <p>OK</p> <p>If there is any error: ERROR Or +CME ERROR: <err></p> |
| Maximum Response Time | - |
| Characteristics | - |

Parameter

| | |
|-------------------------------------|--|
| <connectID> | Integer type. Socket ID. Range: 0–11. |
| <read_length> | Integer type. The maximum length of data to be read. Range: 0–1500; Unit: byte. |
| <read_actual_length> | Integer type. The length of data that has been actually read. Unit: byte. |
| <remoteIP> | String type. The remote IP address. It is valid only when <service_type>="UDP SERVICE" . |
| <remote_port> | Integer type. Remote port. Range: 0–65535. It is valid only when <service_type>="UDP SERVICE" . |
| <data> | The data that has been read. |
| <total_receive_length> | Integer type. The total length of the received data. Unit: byte. |
| <have_read_length> | Integer type. The length of data that has been read. Unit: byte. |
| <unread_length> | Integer type. The length of data that has not been read. Unit: byte. |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

| | |
|---|--|
| | <p>+QIRD: 0</p> <p>好的</p> <p>如存在任何错误： 错误 或 "CME" 错误: <err></p> |
| 写入命令 当 <code><read_length>=0</code> 时，查询已读取 的数据 <code>AT+ QIRD =<connectID>, 0</code> | <p>应答：</p> <p>若指定连接存在： + QIRD : <total_receive_length>, <have_read_length>, <unrea d_leng- th></p> <p>好的</p> <p>如存在任何错误： 错误 或 "CME" 错误: <err></p> |
| 最大响应时间 | - |
| 特征 | - |

参数

| | |
|-----------------------------------|--|
| <连接ID> | 整数类型。套接字ID。范围： 0-11。 |
| <阅读长度> | 整数类型。可读取数据的最大长度。范围： 0-1500；单位：字节。 |
| <read_actual_length> | 整数类型。实际读取的数据长度。单位：字节。 |
| <remoteIP> | 字符串类型。远程IP地址。仅当 <code><service_type>= "UDP服务"</code> 时有效。 |
| <远程端口> | 整数类型。远程端口。范围： 0-65535。仅当 <code><service_type>= "UDP服务"</code> 时有效。 |
| 数据 | 已读取的数据。 |
| <总接收长度> | 整数类型。接收数据的总长度。单位：字节。 |
| <have_read_length> | 整数类型。已读取数据的长度。单位：字节。 |
| <未读长度> | 整数类型。未读取数据的长度。单位：字节。 |
| <err> | 整数类型。错误代码。有关详细信息，请参阅第4章。 |

2.3.12. AT+QISWTMD Switch Data Access Mode

This command switches the data access mode, including buffer access mode, direct push mode and transparent transmission mode. When a socket service is established, the data access mode can be specified by <access_mode> in AT+QIOPEN. After a socket service has been opened, the data access mode can be switched by AT+QISWTMD.

| AT+QISWTMD Switch Data Access Mode | |
|--|---|
| Test Command AT+QISWTMD=? | Response +QISWTMD: (range of supported <connectID>s),(range of supported <access_mode>s) OK |
| Write Command AT+QISWTMD=<connectID>,<access_mode> | Response If <access_mode>=0 or 1 and data access mode is switched successfully: OK If <access_mode>=2 and data access mode is switched successfully, the module will enter transparent transmission mode: CONNECT If there is any error: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | - |
| Characteristic | This command takes effect immediately. The configurations are not saved. |

Parameter

| | |
|---------------|--|
| <connectID> | Integer type. Socket ID. Range: 0–11. |
| <access_mode> | Integer type. Data access mode. 0 Buffer access mode 1 Direct push mode 2 Transparent transmission mode |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

2.3.12. AT+qiswtmd交换机数据访问方式

该命令切换数据访问模式，包括缓冲区访问模式、直接推送模式和透明传输模式。建立一个套接字服务时，可通过AT+ QIOPEN中的access_mode指定数据访问模式。套接字服务开启后，可通过AT+qiswtmd切换数据访问模式。

| AT+qiswtmd交换机数据访问方式 | |
|--|--|
| 测试命令 AT+QISWTMD=? | 应答 +qiswtmd: (<connectID>支持的范围), (<access_mode>支持的范围) 好的 |
| 写入命令 AT+qiswtmd=<连接ID>, <访问模式> | 应答 如果<access_mode>=0或1且数据访问模式已成功切换: 好的 如果<access_mode>=2且数据访问模式切换成功，模块将进入 透明传输模式: 连接/接通 如存在任何错误: 错误 或 “CME” 错误: <err> |
| 最大响应时间 | - |
| 特征性的 | 该命令立即生效。 配置未保存。 |

参数

| | |
|-----------------------|--|
| <connectID><访问模 式> | 整数类型。套接字ID。范围: 0-11。 整数类型。数据访问模式。 0 缓冲存取方式 1 直接推送模式 2 透明透射模式 |
| <err> | 整数类型。错误代码。有关详细信息，请参阅第4章。 |

2.3.13. AT+QPING Ping Remote Server

This command tests the Internet protocol reachability of a host. Before conducting Ping operations, the host should activate the context corresponding to <contextID> by **AT+QIACT**. It will return the result within <timeout> and the default value of <timeout> is 4 seconds.

| AT+QPING Ping Remote Server | |
|---|--|
| Test Command AT+QPING=? | Response: +QPING: (range of supported <contextID>s),<host>,(range of supported <timeout>s),(range of supported <pingnum>s),(range of supported <ping_size>s) OK |
| Write Command AT+QPING=<contextID>,<host>[,<timeout>[,<pingnum>[,<ping_size>]]] | Response If a remote server is Pinged successfully: OK +QPING: <result>[,<IP_address>,<bytes>,<time>,<ttl>] [...] +QPING: <finresult>[,<sent>,<rcvd>,<lost>,<min>,<max>,<avg>] If there is any error: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | - |
| Characteristic | This command takes effect immediately. The configurations are not saved. |

Parameter

| | |
|--------------------------|---|
| <contextID> | Integer type. The PDP context ID. Range: 1–5. |
| <host> | String type. The host address. The format is a domain name or a dotted decimal IP address. |
| <timeout> | Integer type. Sets the maximum time to wait for the response of each Ping request. Range: 1–255; Default value: 4; Unit: s. |
| <pingnum> | Integer type. Sets the maximum number of times for sending Ping request. Range: 1–10; Default value: 4. |
| <ping_size> | Integer type. Sets the maximum byte length of each Ping request Range: 32–1500; |

2.3.13. AT+ QPING Ping远程服务器

该命令测试主机的Internet协议可达性。在执行Ping操作之前，主机应通过**AT+ QIACT**激活与**contextID**对应的上下文。它将在**timeout**内返回结果，且**timeout**的默认值为4秒。

| AT+ QPING Ping远程服务器 | |
|--|--|
| 测试命令 AT+QPING=? | 应答: +QPING : (支持的 <contextID> 范围), <host>, (支持的 <timeout> 范围), (支持的 <pingnum> 范围), (支持的 <ping_size> 范围) 好的 |
| 写入命令 AT+ QPING =<contextID>, <host>[<timeout>[<pingnum>[<ping_size>]]] | 应答 若远程服务器成功收到Ping请求： 好的 + QPING : <result>[<IP_address>, <bytes>, <time>, <ttl>] [...] + QPING : <finresult>[<sent>, <rcvd>, <lost>, <min>, <max>, <avg>] 如存在任何错误： 错误 或 “CME” 错误: <err> |
| 最大响应时间 | - |
| 特征性的 | 该命令立即生效。 配置未保存。 |

参数

| | |
|--------------------------|--|
| 情境ID | 整数类型。PDP上下文ID。范围： 1-5。 |
| 主人 | 字符串类型。主机地址。格式为域名或带点十进制IP地址。 |
| 暂时休息 | 整数类型。设置每个Ping请求响应的最大等待时间。范围： 1-255； 默认值： 4； 单位： 秒。 |
| Pingnum> | 整数类型。设置发送Ping请求的最大次数。范围： 1-10； 默认值： 4。 |
| <ping_size> | 整数类型。设置每次Ping请求的最大字节长度范围： 32-1500； |

| | | |
|--------------|--|--|
| | Default value: 32; Unit: byte. | |
| <result> | Integer type. The result of each Ping request. | |
| 0 | Received the Ping response from the server. In this case, detailed information is contained in <IP_address>,<bytes>,<time>,<ttl>. | |
| Other values | Error codes. Please refer to Chapter 4 . | |
| <IP_address> | String type. The IP address of the remote server in dotted decimal format. | |
| <bytes> | Integer type. The actual length of each sent Ping request. Unit: byte. | |
| <time> | Integer type. The time wait for the response of the Ping request. Unit: ms. | |
| <ttl> | Integer type. Time-to-live (TTL) value of the response packet of the Ping request. | |
| <finresult> | Integer type. The final result of the command. | |
| 0 | It is finished normally. It is successful to activate the context and find the host. In this case, detailed information is contained in <sent>,<rcvd>,<lost>,<min>,<max>,<avg> | |
| Other values | Error codes. Please refer to Chapter 4 . | |
| <sent> | Integer type. Number of times the Ping requests that have been sent. | |
| <rcvd> | Integer type. Number of the Ping requests that have received the response. | |
| <lost> | Integer type. Number of the Ping requests that are timed out. | |
| <min> | Integer type. The minimum response time. Unit: ms. | |
| <max> | Integer type. The maximum response time. Unit: ms. | |
| <avg> | Integer type. The average response time. Unit: ms. | |
| <err> | Integer type. Error codes. For more details, see chapter 4 . | |

2.3.14. AT+QIDNSCFG Configure Address of DNS Server

This command configures address of DNS server. Before the DNS address is set, the host must activate the context corresponding to <contextID> by **AT+QIACT** first.

| AT+QIDNSCFG Configure Address of DNS Server | |
|--|--|
| Test command AT+QIDNSCFG=? | Response +QIDNSCFG: (range of supported <contextID>s),<pridnsaddr>,<secdnsaddr> OK |
| Write Command AT+QIDNSCFG=<contextID>[,<pri dnsaddr>[,<sec dnsaddr>]] | Response If the optional parameters are omitted, query the current DNS server address of a specified PDP context: +QIDNSCFG: <contextID>,<pri dnsaddr>,<sec dnsaddr> OK If the optional parameters are specified, configure the primary and secondary DNS server addresses of a specified PDP context: OK |

默认值：32；单位：字节。

结果 整数类型。每次Ping请求的结果。

0 已从服务器收到Ping响应。此情况下，详细信息包含在<IP_address>, <bytes>, <time>, <ttl>中。

其他值 错误代码。请参阅第4章。

<IP地址> 字符串类型。远程服务器的IP地址，采用点分十进制格式。

字节 整数类型。每个发送的Ping请求的实际长度。单位：字节。

时间 整数类型。Ping请求响应的等待时间。单位：毫秒。

<ttl> 整数类型。Ping请求响应数据包的生存时间（TTL）值。

<finresult> 整数类型。命令的最终结果。

0 操作正常完成。已成功激活上下文并定位主机。此情况下包含详细信息。

<发送>, <接收>, <丢失>, <最小>, <最大>, <平均>

其他值 错误代码。请参阅第4章。

送 整数类型。已发送的Ping请求次数。

被接受 整数类型。已收到响应的Ping请求数量。

失去的 整数类型。超时的Ping请求次数。

分 整数类型。最小响应时间。单位：毫秒（ms）。

<最大值> 整数类型。最大响应时间。单位：毫秒（ms）。

<平均值> 整数类型。平均响应时间。单位：毫秒（ms）。

<err> 整数类型。错误代码。有关详细信息，请参阅第4章。

2.3.14. AT+qidnscfg配置DNS服务器地址

该命令配置DNS服务器地址。在设置DNS地址之前，主机必须先通过AT+ QIACT激活与contextID对应的上下文。

| AT+qidnscfg配置DNS服务器地址 | |
|--|---|
| 测试命令 AT+QIDNSCFG=? | 应答 +qidnscfg: (支持的范围<contextID>s), <pridnsaddr>, <secdnsaddr> 好的 |
| 写入命令 AT+qidnscfg=<contextID>[<pridnsaddr>[<secdnsaddr>]] | 应答 若省略可选参数，则查询指定PDP上下文的当前DNS服务器地址： +QIDNSCFG: <contextID>,<pridnsaddr>,<secdnsaddr> 好的 若已指定可选参数，请配置指定PDP上下文的主DNS和备用DNS服务器地址。 好的 |

| | |
|-----------------------|--|
| | If there is any error: ERROR Or +CME ERROR: <err> |
| Maximum Response Time | - |
| Characteristics | This command takes effect immediately. The configurations are not saved. |

Parameter

| | |
|---------------------------|--|
| <contextID> | Integer type. The PDP context ID. Range: 1–5. |
| <pridnsaddr> | String type. The primary DNS server address. |
| <secdnsaddr> | String type. The secondary DNS server address. |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

NOTE

1. Only IPv4 DNS address can be set in IPv4.
2. Only IPv6 DNS address can be set in IPv6.

2.3.15. AT+QISDE Control Whether to Echo the Data to be Sent by AT+QISEND

This command controls whether to echo the data to be sent by **AT+QISEND**, that is, whether to echo the input data to be sent.

| AT+QISDE Control Whether to Echo the Data to be Sent by AT+QISEND | |
|--|--|
| Test Command AT+QISDE=? | Response +QISDE: (list of supported <echoes>) OK |
| Read Command AT+QISDE? | Response +QISDE: <echo> OK |
| Write Command AT+QISDE=<echo> | Response OK If there is any error: ERROR Or |

| | |
|--------|--|
| | 如存在任何错误: 错误 或 “CME” 错误: <err> |
| 最大响应时间 | - |
| 特征 | 该命令立即生效。 配置未保存。 |

参数

| | |
|--------------|---------------------------|
| 情境ID | 整数类型。PDP上下文ID。范围: 1-5。 |
| <pridnsaddr> | 字符串类型。主DNS服务器地址。 |
| <secdnsaddr> | 字符串类型。二级DNS服务器地址。 |
| <err> | 整数类型。错误代码。有关详细信息, 请参阅第4章。 |

注释

1. IPv4环境下仅支持设置IPv4 DNS地址。
2. IPv6中只能设置IPv6 DNS地址。

2.3.15. AT+ QISDE 控制是否回传AT+ QISEND 发送的数据

该命令控制是否回显AT+ QISEND发送的数据, 即是否回显待发送的输入数据。

| AT+ QISDE 控制是否回传AT+ QISEND 发送的数据 | |
|--------------------------------------|---|
| 测试命令 AT+QISDE=? | 应答 +QISDE : (支持的 <echo>列表) 好的 |
| 读命令 AT+QISDE? | 应答 +QISDE: <echo> 好的 |
| 写入命令 AT+QISDE=<echo> | 应答 好的 如存在任何错误: 错误 或 |

| | |
|-----------------------|---|
| | +CME ERROR: <err> |
| Maximum Response Time | - |
| Characteristic | This command takes effect immediately. The configurations are not saved. |

Parameter

| | |
|---------------------|---|
| <echo> | Integer type. Whether to echo the data to be sent by AT+QISEND . 0 Not echo the data 1 Echo the data |
| <err> | Integer type. Error codes. For more details, see chapter 4 . |

2.3.16. AT+QIGETERROR Query Error Code of the Last AT Command

If **ERROR** is returned after TCP/IP related commands are executed, the details of error can be queried by **AT+QIGETERROR**. Please note that **AT+QIGETERROR** only returns the error code of the last TCP/IP related AT command.

AT+QIGETERROR Query Error Code of the Last AT Command

| | |
|---|--|
| Test Command AT+QIGETERROR=? | Response OK |
| Execution Command AT+QIGETERROR | Response +QIGETERROR: <err>,<errcode_description> OK |
| Maximum Response Time | - |
| Characteristic | - |

Parameter

| | |
|------------------------------------|--|
| <err> | Integer type. Error codes. For more details, see chapter 4 . |
| <errcode_description> | String type. Indicates the details of error. Please refer to Chapter 4 for details. |

| | |
|--------|--------------------|
| | "CME" 错误: <err> |
| 最大响应时间 | - |
| 特征性的 | 该命令立即生效。 配置未保存。 |

参数**回声**

整数类型。是否回显AT+ QISEND发送的数据。0 不回显数据

1 回声数据

<err> 整数类型。错误代码。有关详细信息，请参阅[第4章](#)。

2.3.16. AT+qigeterror最后一条AT命令的查询错误码

如果执行了与TCP/IP相关的命令后返回了错误，则可以通过**AT+qigeterror**查询错误的详细信息。请注意，**AT+qigeterror**仅返回了最后一条与TCP/IP相关的AT命令的错误代码。

AT+qigeterror最后一条AT命令的查询错误码

| | |
|--------------------------------|--|
| 测试命令 AT+QIGETERROR=? | 应答 好的 |
| 执行命令 AT+QI 错误 | 应答 +qigeterror: <err>, <errcode_description> |
| | 好的 |
| 最大响应时间 | - |
| 特征性的 | - |

参数**<err>**

整数类型。错误代码。有关详细信息，请参阅[第4章](#)。字符

<errcode_description>

[第4章](#)关于

串类型。指示错误的详细信息。请参阅详细信息。

2.4. URC Description

+QIURC: is used at the beginning of URCs of TCP/IP related AT commands to be reported to the host. The URC contains the reports about incoming data, closed connection, incoming connection and so on. Actually, **<CR><LF>** occurs at both the beginning and end of URCs, but **<CR><LF>** is not presented intentionally in this document.

2.4.1. +QIURC: "closed" URC Indicating Closed Connection

When TCP socket service is closed by remote client or due to network error, the URC will be reported, and the status of socket service will be "closing" (**<socket_state>=4**). **AT+QICLOSE=<connectID>** can be used to restore the **<socket_state>** to "initial" state.

+QIURC: "closed" URC Indicating Closed Connection

| | |
|------------------------------|--------------------------------------|
| +QIURC: "closed",<connectID> | Socket service connection is closed. |
|------------------------------|--------------------------------------|

Parameter

| | |
|--------------------------|---------------------------------------|
| <connectID> | Integer type. Socket ID. Range: 0–11. |
|--------------------------|---------------------------------------|

2.4.2. +QIURC: "recv" URC Indicating Incoming Data

In buffer access mode or direct push mode, the module will report the URC to the host after receiving data.

- In buffer access mode: the URC format is **+QIURC: "recv",<connectID>**. The host can read data by **AT+QIRD** after URC is reported. Please note that if the buffer is not empty, when the module receives data again, it will not report a new URC until all the received data has been read from the buffer by **AT+QIRD**.
- In direct push mode: the received data will be outputted via COM port directly.

+QIURC: "recv" URC Indicating Incoming Data

| | |
|---|---|
| +QIURC: "recv",<connectID> | It will be reported when the module receives the incoming data in buffer access mode. The host can receive data by AT+QIRD . |
| +QIURC: "recv",<connectID>,<current_recvlength><CR><LF><data> | It will be reported when the module receives the incoming data and the <service_type>="TCP", "UDP", or "TCP INCOMING" in direct push mode. |
| +QIURC: "recv",<connectID>,<current_recvlength> | It will be reported when the module receives the incoming data |

2.4. URC描述

+**QIURC**：用于TCP/IP相关AT命令的URC开头，用于向主机报告。URC包含关于传入数据、关闭连接、传入连接等的报告。实际上，<CR><LF>既出现在URC的开头也出现在URC的结尾，但<CR><LF>在本文档中并非有意呈现。

2.4.1. + QIURC：“closed” URC 表示连接已关闭

当TCP套接字服务被远程客户端关闭或由于网络错误时，将报告URC，且套接字服务的状态将为“关闭”（socket_state=4）。AT+qiclose=<connectID>可用于将socket_state恢复至“初始”状态。

+ QIURC：“closed” URC 表示连接已关闭

+QIURC：“closed”，<connectID>套接字服务连接已关闭。

参数

<connectID> 整数类型。套接字ID。范围：0–11。

2.4.2. + QIURC：“recv” URC（统一资源控制）表示接收数据

在缓冲区访问模式或直接推送模式下，模块将在接收到数据后向主机报告URC。

- 在缓冲区访问模式下:URC格式为+QIURC：“recv”，<connectID>。主机可以在URC报告后通过AT+ QIRD读取数据。请注意，如果缓冲区不为空，当模块再次接收数据时，它将不会报告新的URC，直到所有接收到的数据都已通过AT+ QIRD从缓冲区读取。
- 在直接推送模式下：接收到的数据将通过COM端口直接输出。

+ QIURC：“recv” URC（统一资源控制）表示接收数据

| | |
|--|--|
| +QIURC: "recv",<connectID> | 当模块以缓冲区访问模式接收传入数据时，系统将发出通知。 主机可通过AT+ QIRD接收数据。 |
| + QIURC：“接收”，<连接ID>，<当前 nt接收长度><CR><LF><数据> | 当模块接收到传入数据时将进行上报 以及 <service_type>= “TCP”、“UDP” 或直接推送模式下的 “TCP incoming”。 |
| + QIURC：“接收”，<连接ID>，<当前 | 当模块接收到传入数据时将进行上报 |

<nt_recvlength>,<remotelP>,<remote_port><CR><LF><data> and **<service_type>="UDP SERVICE"** in direct push mode.

Parameter

| | |
|----------------------------------|--|
| <connectID> | Integer type. Socket ID. Range: 0–11. |
| <currentrecvlength> | Integer type. The length of actually received data. |
| <remotelP> | String type. Remote IP address (It must be dotted decimal format). |
| <remote_port> | Integer type. Remote port. Range: 1–65535. |
| <data> | The received data. |

2.4.3. +QIURC: "incoming full" URC Indicating Incoming Connection Reaches Limit

If the incoming connection reaches limit, or no socket system resources can be allocated, the module will report the URC **+QIURC: "incoming full",<serverID>** when there is new incoming connection request.

+QIURC: "incoming full" URC Indicating Incoming Connection Reaches Limit

| | |
|--------------------------------|--|
| +QIURC: "incoming full" | The URC indicates the incoming connection reaches limit. |
|--------------------------------|--|

2.4.4. +QIURC: "incoming" URC Indicating Incoming Client Connection

If the **<service_type>="TCP LISTENER"**, when a remote client connects to this server, the host will automatically assign an available **<connectID>** for the new connection. The range of **<connectID>** is 0–11. In such case, the module will report the URC. The **<service_type>** of the new connection will be "TCP INCOMING", and the **<access_mode>** will be buffer access mode.

+QIURC: "incoming" URC Indicating Incoming Client Connection

| | |
|---|---|
| +QIURC: "incoming",<connectID>,<serverID>,<remotelP>,<remote_port> | When the new incoming connection is accepted by <serverID> , the allocated <connectID> , <remotelP> and <remote_port> will be reported by this URC. |
|---|---|

Parameter

| | |
|----------------------------|---|
| <connectID> | Integer type. Socket ID that is automatically specified by the module for the incoming client connection. Range: 0–11. |
| <serverID> | Integer type. Server of accepting the incoming <connectID> . <service_type> is "TCP LISTENER" and listening socket ID is <serverID> of the server. |
| <remotelP> | String type. Remote IP address of the incoming <connectID> . Range: 1–65535. |
| <remote_port> | Integer type. Remote port of the incoming <connectID> . Range: 1–65535. |

网络接收长度、远程IP地址、远程端口<CR> 并且服务类型=“UDP服务”采用直接推送模式。
<LF><数据>

参数

| | |
|---------------------|----------------------------|
| <连接ID> | 整数类型。套接字ID。范围：0-11。 |
| <currentrecvlength> | 整数类型。实际接收数据的长度。 |
| <remoteIP> | 字符串类型。远程IP地址（必须采用点分十进制格式）。 |
| <远程端口> | 整数类型。远程端口。范围：1-65535。 |
| 数据 | 接收数据 |

2.4.3. + QIURC：“incoming full” URC（用户资源控制）表示传入连接已达上限

如果传入连接达到限制，或者无法分配任何套接字系统资源，当有新的传入连接请求时，该模块将报告URC +QIURC：“传入满”，<serverID>。

+ QIURC：“传入全” URC指示传入连接达到限制

+ QIURC：“传入全” URC表示传入连接已达上限。

2.4.4. + QIURC：“incoming” URC（统一资源控制）表示客户端连接即将建立

如果<service_type>=“TCP监听器”，当远程客户端连接到该服务器时，主机将自动为新连接分配可用的<connectID>。<connectID>的范围为0-11。在此情况下，模块将报告URC。新连接的<service_type>将为“TCP传入”，且<access_mode>将采用缓冲区访问模式。

+ QIURC：“incoming” URC（统一资源控制）表示客户端连接即将建立

+ QIURC：“incoming”，<connectID>，<s 当新连接被接受时

服务器ID、远程IP地址、远程端口

服务器ID、分配的连接ID、<remoteIP>和remote_port将由该URC报告。

参数

| | |
|------------|--|
| <连接ID> | 整数类型。由模块自动指定的用于接收客户端连接的套接字ID。范围：0-11。 |
| <服务器ID> | 整数类型。服务器接受传入的<connectID>。<service_type>为“TCP监听器”，监听套接字ID为服务器的<serverID>。 |
| <remoteIP> | 字符串类型。传入的<connectID>的远程IP地址。范围：1-65535。 |
| <远程端口> | 整数类型。传入的<connectID>的远程端口。范围：1-65535。 |

2.4.5. +QIURC: "pdpdeact" URC Indicating PDP Deactivation

PDP context may be deactivated by the network. The module will report the URC to the host about PDP deactivation. In such case, the host must execute **AT+QIDEACT** to deactivate the context and reset all connections.

+QIURC: "pdpdeact" URC Indicating PDP Deactivation

| | |
|--------------------------------|--|
| +QIURC: "pdpdeact",<contextID> | The context corresponding to <contextID> is deactivated. |
|--------------------------------|--|

Parameter

| | |
|-------------|---|
| <contextID> | Integer type. The PDP context ID. Range: 1–5. |
|-------------|---|

2.4.5. +QIURC：“pdpdeact” URC 指示PDP失活

网络可能会停用PDP上下文。该模块将向主机报告URC以停用PDP上下文。在此情况下，主机必须执行AT+qideact以停用上下文并重置所有连接。

+ QIURC：“pdpdeact” URC 指示PDP失活

+QIURC：“pdpdeact”，<contextID>对应<contextID>的上下文已停用。

参数

<contextID>整数类型。PDP上下文ID。范围：1-5。

3 Example

3.1. Configure and Activate a Context

3.1.1. Configure a Context

```
AT+QICSGP=1,1,"UNINET","","","",0      //Configure context 1. APN is "UNINET" for China Unicom.  
OK
```

3.1.2. Activate a Context

```
AT+QIACT=1          //Activate context 1. Depending on the network, the maximum  
                    response time is 150 s.  
OK                  //Activated the context successfully.  
AT+QIACT?  
+QIACT: 1,1,1,"10.7.157.1"  
  
OK
```

3.1.3. Deactivate a Context

```
AT+QIDEACT=1        //Deactivate context 1.  
OK                  //Deactivated the context successfully. Depending on the  
                    network, the maximum response time is 40 s.
```

3.2. TCP Client Works in Buffer Access Mode

3.2.1. Set up a TCP Client Connection and Enter Buffer Access Mode

```
AT+QIOPEN=1,0,"TCP","220.180.239.212",8009,0,0  //Context is 1 and <connectID> is 0. Before  
                                                using AT+QIOPEN, the host should activate  
                                                the context by AT+QIACT.  
OK
```

3 样例

3.1. 配置和激活上下文

3.1.1. 配置上下文

```
AT+QICSGP=1,1, "联通", "", 0          //配置上下文1 APN 为中国联通的 UNINET。  
好的
```

3.1.2. 激活上下文

```
AT+QIACT=1          //激活上下文1。根据网络情况，最大  
                    反应时间为150秒。  
好的                //上下文已成功激活。  
AT+QIACT?  
+QIACT: 1,1,1,"10.7.157.1"  
  
好的
```

3.1.3. 使上下文失效

```
AT+QIDECT=1         //停用上下文1。  
好的                //已成功停用上下文。具体取决于  
                    网络中，最大响应时间为40秒。
```

3.2. TCP客户端在缓冲区访问模式下的工作

3.2.1. 建立TCP客户端连接并进入缓冲区访问模式

```
AT+ QIOPEN =1,0, "TCP", "220.180.239.212", 8009,0 //上下文为1且connectID>0。在使用  
AT+ QIOPEN前，主机应通过AT+ QIACT激  
活上下文。  
好的
```

```
+QIOPEN: 0,0 //TCP client is connected successfully. It is recommended to wait for the URC for 150 s.  
AT+QISTATE=1,0 //Check whether the connection status of <connectID> is 0.  
+QISTATE: 0,"TCP","220.180.239.201",8009,65514,2,1,0,0,"usbmodem"  
OK
```

3.2.2. Send Data in Buffer Access Mode

```
AT+QISEND=0 //Send variable-length data.  
> test1<ctrl+Z>  
SEND OK //SEND OK does not mean the data has been sent to the server successfully. The host can query whether the data has reached the server by AT+QISEND=0,0.  
AT+QISEND=0,4 //Send fixed-length data and the data length is 4 bytes.  
> test  
SEND OK  
AT+QISEND=0,0 //Query the length of sent data.  
+QISEND: 9,9,0  
OK
```

3.2.3. Receive Data from Remote Server in Buffer Access Mode

```
+QIURC: "recv",0 //Data received when <connectID>=0.  
AT+QIRD=0,1500 //Read data and the length of data is 1500 bytes.  
+QIRD: 5 //The length of actually received data is 5 bytes.  
test1  
  
OK  
AT+QICFG="recvind",1  
OK  
+QIURC: "recv",0,5 //5-byte data received when <connectID>=0  
AT+QIRD=0,1500 //Read data and the length of data is 1500 bytes.  
+QIRD: 5 //The length of actually received data is 5 bytes.  
test1  
  
OK
```

+QIOPEN: 0,0

//TCP客户端已成功连接。

建议等待URC 150秒。如果150秒内无法接收，

主机可以使用AT+qiclose来关闭套接字。

AT+Q状态=1.0

//检查连接状态是否正常

<connectID>为 0。

+QISTATE: 0,"TCP","220.180.239.201",8009,65514,2,1,0,0,"usbmodem"

好的

3.2.2. 缓冲存取方式的数据发送

AT+QISEND=0

//发送可变长度数据。

> test1<Ctrl+Z>

发送

//SEND OK并不表示数据已发送至服务器

成功。主机可以通过AT+ QISEND =0,0查询数据是否已到达服务器。

AT+QISEND=0.4

//发送固定长度数据，数据长度为4字节。

试验

发送

AT+QISEND=0.0

//查询已发送数据的长度。

+QISEND: 9,9,0

好的

3.2.3. 缓冲访问模式下从远程服务器接收数据

+QIURC: "recv",0

//接收到的数据<connectID>=0.

AT+QIRD=0,1500

//读取数据，数据长度为1500字节。

+QIRD: 5

//实际接收数据长度为5字节。

测试1

好的

AT+ QICFG = “接收中” , 1

好的

+QIURC: "recv",0,5

//接收到5字节数据，当<connectID>=0时

AT+QIRD=0,1500

//读取数据，数据长度为1500字节。

+QIRD: 5

//实际接收数据长度为5字节。

测试1

好的

AT+QIRD=0,1500**+QIRD: 0** //No data in buffer.

OK

AT+QIRD=0,0**+QIRD: 10,10,0** //Query the total length of received data, including read and unread data.

OK

3.2.4. Close a Connection

AT+QICLOSE=0

//Close a connection whose <connectID> is 0. Depending on the network, the maximum response time is 10 s.

OK

3.3. TCP Client Works in Transparent Transmission Mode

3.3.1. Set up a TCP Client Connection and Enter Transparent Transmission Mode

AT+QIOPEN=1,0,"TCP","220.180.239.212",8009,0,2 //Context is 1 and <connectID> is 0. Before using **AT+QIOPEN**, the host should activate the context with **AT+QIACT**.**CONNECT**//TCP client is connected successfully. It is recommended to wait for the URC **CONNECT** for 150 s. If it cannot be received in 150 s, the host could use **AT+QICLOSE** to close the socket.

3.3.2. Send Data in Transparent Transmission Mode

<All data got from COM port will be sent to internet directly>

3.3.3. Receive Data from Remote Server in Transparent Transmission Mode

Test 1

//All data received from Internet will be outputted via COM port directly.

AT+QIRD=0,1500**+QIRD: 0** //缓冲区中无数据。

好的

AT+QIRD=0.0

//查询已接收数据的总长度，包括已读取和未读取的数据。

+QIRD: 10,10,0

好的

3.2.4. 关闭连接

AT+QICLOSE=0

//关闭<连接ID为0的连接。根据具体情况

网络中，最大响应时间为10秒。

好的

3.3. 透明传输模式下的TCP客户端

3.3.1. 建立TCP客户端连接并进入透明传输模式

AT+ QIOPEN =1,0, "TCP" , "220.180.239.212" , 8009,0,2 //上下文为1且connectID>为0。在使用

AT+ QIOPEN前，主机应通过AT+ QIACT激活

上下文。

连接/接通

//TCP客户端已成功连接。

建议等待URC连接150秒。如果150秒内无法接

收，主机可以使用AT+qiclose来关闭套接字。

3.3.2. 透明传输模式下的数据发送

所有从COM端口获取的数据将直接发送至互联网

3.3.3. 透明传输模式下从远程服务器接收数据

试验1

//所有从互联网接收的数据将通过
直接连接COM端口。

3.3.4. Close a TCP Client

AT+QICLOSE=0

//After using **+++** to exit from the transparent transmission mode, the host could use **AT+QICLOSE** to close the TCP connection. Depending on the network, the maximum response time is 10 s.

OK

3.4. TCP Client Works in Direct Push Mode

3.4.1. Set up a TCP Client Connection and Enter Direct Push Mode

AT+QIOPEN=1,0,"TCP","220.180.239.212",8009,0,1 //Context is 1 and <connectID> is 0. Before executing **AT+QIOPEN**, the host should activate the context with **AT+QIACT**.

OK

+QIOPEN: 0,0

//TCP client is connected successfully. It is suggested to wait for the URC for 150 s. If it cannot be received in 150 s, the host could use **AT+QICLOSE** to close Socket.

AT+QISTATE=1,0

//Query whether the connection status of <connectID> is 0.

+QISTATE: 0,"TCP","220.180.239.201",8009,65344,2,1,0,1,"usbmodem"

OK

3.4.2. Send Data in Direct Push Mode

AT+QISEND=0

//Send variable-length data.

> test1<ctrl+Z>

SEND OK

//**SEND OK** does not mean the data has been sent to the server successfully. Host can query whether the data has reached the server via **AT+QISEND=0,0**.

//Send fixed-length data and the data length is 5 bytes.

AT+QISEND=0,5

> test2

SEND OK

AT+QISEND=0,0

//Query the length of sent data, acknowledged data and unacknowledged data.

3.3.4. 关闭TCP客户端

AT+QICLOSE=0

//使用+++退出透明界面后

传输模式下，主机可使用**AT+qiclose**关闭TCP连

接。根据网络情况，最大响应时间为10秒。

好的

3.4. TCP客户端直接推送工作模式

3.4.1. 建立TCP客户端连接并进入直接推送模式

AT+ QIOPEN =1,0, "TCP" , "220.180.239.212" , 8009,0,1//上下文为1且**connectID>**为0。在执行

AT+ QIOPEN之前，主机应通过**AT+ QIACT**激活上下文。

好的

+QIOPEN: 0,0

//TCP客户端已成功连接。

建议等待URC 150秒。若150秒内未收到URC，

主机可使用**AT+qiclose**关闭Socket。

AT+Q状态=1.0

//查询连接状态是否

<connectID>为 0。

+QISTATE: 0,"TCP","220.180.239.201",8009,65344,2,1,0,1,"usbmodem"

好的

3.4.2. 直接推送模式下的数据发送

AT+QISEND=0

//Send variable-length data.

> test1<Ctrl+Z>

发送

//**SEND OK**不表示数据已成功发送到服务器。主机可

通过**AT+ QISEND =0,0**查询数据是否已到达服务器。

//发送固定长度数据，数据长度为5字节。

AT+QISEND=0.5

> 测试2

发送

AT+QISEND=0.0

//查询已发送数据、已确认数据及未确认数据的长度。

```
+QISEND: 10,10,0
```

```
OK
```

3.4.3. Receive Data from Remote Server in Direct Push Mode

```
+QIURC: "recv",0,4 //Receive data from remote server.  
test
```

3.4.4. Close a TCP Client

```
AT+QICLOSE=0 //Close the connection whose <connectID> is 0.  
Depending on the network, the maximum response time  
is 10 s.
```

```
OK
```

3.5. TCP Server Works in Buffer Access Mode

3.5.1. Start a TCP Server

```
AT+QIOPEN=1,1,"TCP LISTENER","127.0.0.1",0,2020,0 //Context is 1 and <connectID> is 1. Before  
using AT+QIOPEN, the host should activate the context with AT+QIACT.
```

```
OK
```

```
+QIOPEN: 1,0 //TCP server is opened successfully.  
AT+QISTATE=0,1 //Query whether the connection state of  
<contextID> is 1.  
+QISTATE: 1,"TCP LISTENER","127.0.0.1",0,2020,3,1,1,0,"usbmodem"
```

```
OK
```

3.5.2. Accept TCP Incoming Connection from Client

```
+QIURC: "incoming",11,1,"172.31.242.222",54091 //Accept a TCP connection. The <service_type>  
is "TCP incoming", and <connectID> is 11.
```

+QISEND: 10,10,0

好的

3.4.3. 直接推送模式下从远程服务器接收数据

+QIURC: "recv",0,4

//从远程服务器接收数据。

试验

3.4.4. 关闭TCP客户端

AT+QICLOSE=0

//关闭 <connectID>为 0 的连接。

根据网络情况，最大响应时间为10秒。

好的

3.5. TCP服务器在缓冲区访问模式下的工作

3.5.1. 启动TCP服务器

AT+ QIOPEN =1,1, "TCP listener" , "127.0.0.1" , 0.2020.0//上下文为1且<connectID>为1。在使用

AT+ QIOPEN 之前，主机应通过 AT+

QIACT激活上下文。

好的

+QIOPEN: 1,0

//TCP服务器已成功建立连接。

AT+Q状态=0,1

//查询连接状态是否

<covidID>是 1。

+qistate: 1, "TCP监听器" , "127.0.0.1" , 0.2020.3,1,1,0, "USB调制解调器"

好的

3.5.2. 接受客户端的TCP传入连接

+QIURC : "incoming" , 11,1, "172.31.242.222" , 54091//接受TCP连接。服务类型为 "TCP incoming" ，连接ID为11。

3.5.3. Receive Data from Client

```
+QIURC: "recv",11                                //Received data from remote incoming connection.  
AT+QIRD=11,1500                                //Read data received from incoming connection.  
+QIRD: 4                                         //Actual data length is 4 bytes.  
test  
  
OK  
AT+QIRD=11,1500  
+QIRD: 0                                         //No data in buffer.  
  
OK  
AT+QIRD=11,0                                    //Query the total length of received data, including read and unread data.  
+QIRD: 4,4,0  
  
OK
```

3.5.4. Close a TCP Server Connection

```
AT+QICLOSE=11                                //Close the incoming connection. Depending on the network, the maximum response time is 10 s.  
OK  
AT+QICLOSE=1                                //Close TCP server listening.  
OK
```

3.6. Example of UDP Service

```
AT+QIOPEN=1,2,"UDP SERVICE","127.0.0.1",0,3030,0 //Start a UDP service. The <connectID> is 2 and <contextID> is 1. Before using AT+QIOPEN, the host should activate the context with AT+QIACT first.  
OK  
  
+QIOPEN: 2,0                                     //UDP service is started successfully.  
AT+QISTATE=0,1                                //Query whether the connection status of <connectID> is 1.
```

3.5.3. 从客户机接收数据

+QIURC: "recv",11 //接收来自远程传入的数据

关系

AT+QIRD=11,1500

//从入站连接读取数据。

+QIRD: 4

//实际数据长度为4字节。

试验

好的

AT+QIRD=11,1500

+QIRD: 0

//缓冲区中无数据。

好的

AT+QIRD=11.0

//查询已接收数据的总长度，包括
已读取与未读取数据

+QIRD: 4,4,0

好的

3.5.4. 关闭TCP服务器连接

AT+QICLOSE=11

//关闭接收连接。根据
该网络的最大响应时间为10秒。

好的

AT+QICLOSE=1

关闭TCP服务器监听。

好的

3.6. UDP服务实例

3.6.1. 启动UDP服务

AT+QIOPEN=1,2, "UDP服务", "127.0.0.1", 0, 3030, 0 //启动UDP服务。connectID>为2, context

tID>为1。使用AT+QIOPEN前，主机需先

通过AT+QIACT激活上下文。

好的

+QIOPEN: 2,0

//UDP服务已成功启动。

AT+Q状态=0,1

//查询连接状态是否

<connectID>是 1。

```
+QISTATE: 2,"UDP SERVICE","127.0.0.1",0,3030,2,1,2,0,"usbmodem"
```

```
OK
```

3.6.2. Send UDP Data to Remote Server

```
AT+QISEND=2,10,"10.7.89.10",6969
```

//Send 10-byte data to remote server whose IP is 10.7.89.10 and the remote port is 6969.

```
>1234567890
```

```
SEND OK
```

3.6.3. Receive Data from Remote Side

```
+QIURC: "recv",2
```

```
AT+QIRD=2
```

//Receive data from remote side.

```
+QIRD: 4,"10.7.76.34",7687
```

//Read UDP data. One whole UDP packet will be outputted. There is no need to specify the read length.

//Data length is 4 bytes. The remote IP address is 10.7.76.34 and remote port is 7687.

```
AAAA
```

```
OK
```

```
AT+QIRD=2
```

```
+QIRD: 0
```

//Read data.

//No data in buffer.

```
OK
```

```
AT+QISEND=2,10,"10.7.76.34",7687
```

//Send data to the remote whose IP is 10.7.76.34 and remote port is 7687.

```
>1234567890
```

```
SEND OK
```

3.6.4. Close a UDP Service

```
AT+QICLOSE=2
```

//Close the service.

```
OK
```

```
+qistate: 2, "UDP服务" , "127.0.0.1" , 0,3030,2,1,2,0, "USB调制解调器"
```

好的

3.6.2. 向远程服务器发送UDP数据

```
AT+ QISEND =2,10, "10.7.89.10" , 6969 //向指定IP地址的远程服务器发送10字节数据  
是10.7.89.10, 远程端口为6969。
```

>1234567890

发送

3.6.3. 从远程接收数据

```
+QIURC: "recv",2 //接收来自远程端的数据。  
AT+QIRD=2 //读取UDP数据。一个完整的UDP数据包将  
无需指定读取长度。
```

```
+QIRD: 4,"10.7.76.34",7687 //数据长度为4字节。远程IP地址是  
10.7.76.34, 远程端口为7687。
```

澳大利亚农业航空协会

好的
AT+QIRD=2 //读取数据。
+QIRD: 0 //缓冲区中无数据。

好的
AT+ QISEND =2,10, "10.7.76.34" , 7687 //向IP为10.7.76.34的远程发送数据
远程端口为7687。

>1234567890

发送

3.6.4. 关闭UDP服务

```
AT+QICLOSE=2 //关闭服务。  
好的
```

3.7. PING

AT+QPING=1,"www.baidu.com"

//Ping www.baidu.com in context 1. Before Pinging the target IP address, the host should activate the context with **AT+QIACT**.

OK

+QPING: 0,"61.135.169.125",32,192,255

+QPING: 0,"61.135.169.125",32,240,255

+QPING: 0,"61.135.169.125",32,241,255

+QPING: 0,"61.135.169.125",32,479,255

+QPING: 0,4,4,0,192,479,288

3.8. Get Last Error Code

AT+QIOPEN=1,"TCP","220.180.239.212",8009,0,1

//Open a socket service, and <connectID> is not specified.

ERROR

AT+QIGETERROR

+QIGETERROR: 552, invalid parameters

OK

3.7. 冰点

AT+QPING =1, "www.baidu.com"

//Ping www.baidu.com在上下文1中。在Ping之前

目标IP地址，主机应通过**AT+QIACT**激活上下文。

好的

+QPING: 0,"61.135.169.125",32,192,255

+QPING: 0,"61.135.169.125",32,240,255

+QPING: 0,"61.135.169.125",32,241,255

+QPING: 0,"61.135.169.125",32,479,255

+QPING: 0,4,4,0,192,479,288

3.8. 获取最后错误代码

AT+QIOPEN =1, "TCP" , "220.180.239.212" , 8009,0,1//打开一个套接字服务，且未指定<connectID>。

错误

AT+QI错误

+qigeterror: 552, 参数无效

好的

4 Summary of Error Codes

If **ERROR** is returned after executing TCP/IP related AT commands, the details of error type can be queried by **AT+QIGETERROR**. Please note that **AT+QIGETERROR** just returns error code of the last TCP/IP AT command.

Table 2: Summary of Error Codes

| <err> | <errcode_description> | Meaning |
|-------|-------------------------------|-------------------------------|
| 0 | Operation success | Operation success |
| 550 | Unknown error | Unknown error |
| 551 | Operation blocked | Operation blocked |
| 552 | Invalid parameters | Invalid parameters |
| 553 | Memory not enough | Memory not enough |
| 554 | Socket creation failed | Socket creation failed |
| 555 | Operation not supported | Operation not supported |
| 556 | Socket bind failed | Socket bind failed |
| 557 | Socket listen failed | Socket listen failed |
| 558 | Socket write failed | Socket write failed |
| 559 | Socket read failed | Socket read failed |
| 560 | Socket accept failed | Socket accept failed |
| 561 | PDP context opening failed | PDP context open failed |
| 562 | PDP context closure failed | PDP context close failed |
| 563 | Socket identity has been used | Socket identity has been used |
| 564 | DNS busy | DNS busy |
| 565 | DNS parse failed | DNS parse failed |

4 错误代码摘要

执行TCP/IP相关AT命令后返回错误，可通过**AT+qigeterror**查询错误类型详情。请注意**AT+qigeterror**仅返回最后一条TCP/IP AT命令的错误代码。

表2：错误代码汇总

| <err> | <errcode_description> | 意义 |
|-------|-----------------------|------------|
| 0 | 操作成功 | 操作成功 |
| 550 | 未知错误 | 未知错误 |
| 551 | 操作被阻止 | 操作被阻止 |
| 552 | 无效参数 | 无效参数 |
| 553 | 记忆不足 | 记忆不足 |
| 554 | 套接字创建失败 | 套接字创建失败 |
| 555 | 操作不受支持 | 操作不受支持 |
| 556 | 套接字绑定失败 | 套接字绑定失败 |
| 557 | 套接字监听失败 | 套接字监听失败 |
| 558 | 套接字写入失败 | 套接字写入失败 |
| 559 | 读取套接字失败 | 读取套接字失败 |
| 560 | 接受套接字失败 | 接受套接字失败 |
| 561 | PDP上下文打开失败 | PDP上下文打开失败 |
| 562 | PDP上下文关闭失败 | PDP上下文关闭失败 |
| 563 | 已使用套接字身份 | 已使用套接字身份 |
| 564 | DNS 正忙 | DNS 正忙 |
| 565 | DNS解析失败 | DNS解析失败 |

| | | |
|-----|-------------------------|-------------------------|
| 566 | Socket connect failed | Socket connect failed |
| 567 | Socket has been closed | Socket has been closed |
| 568 | Operation busy | Operation busy |
| 569 | Operation timeout | Operation timeout |
| 570 | PDP context broken down | PDP context broken down |
| 571 | PDP context broken down | Cancel sending |
| 572 | Operation not allowed | Operation not allowed |
| 573 | APN not configured | APN not configured |
| 574 | Port busy | Port busy |

| | | |
|-----|----------|----------|
| 566 | 套接字连接失败 | 套接字连接失败 |
| 567 | 插座已关闭 | 插座已关闭 |
| 568 | 操作繁忙 | 操作繁忙 |
| 569 | 操作超时 | 操作超时 |
| 570 | PDP上下文中断 | PDP上下文中断 |
| 571 | PDP上下文中断 | 取消发送 |
| 572 | 操作不允许 | 操作不允许 |
| 573 | APN 未配置 | APN 未配置 |
| 574 | 端口忙 | 端口忙 |
